1/9 - 2023-12-08 14:54 UTC

2023 Nov 20/21 - stage 4 and 5 - 3/9. Stage 4 crystals. This stage had also the spatial halo what Walt Tape calls the superparhelia (raypath 315), nicely visible from the side of the beam. They seem to form always when plate oriented crystals are thick enough.

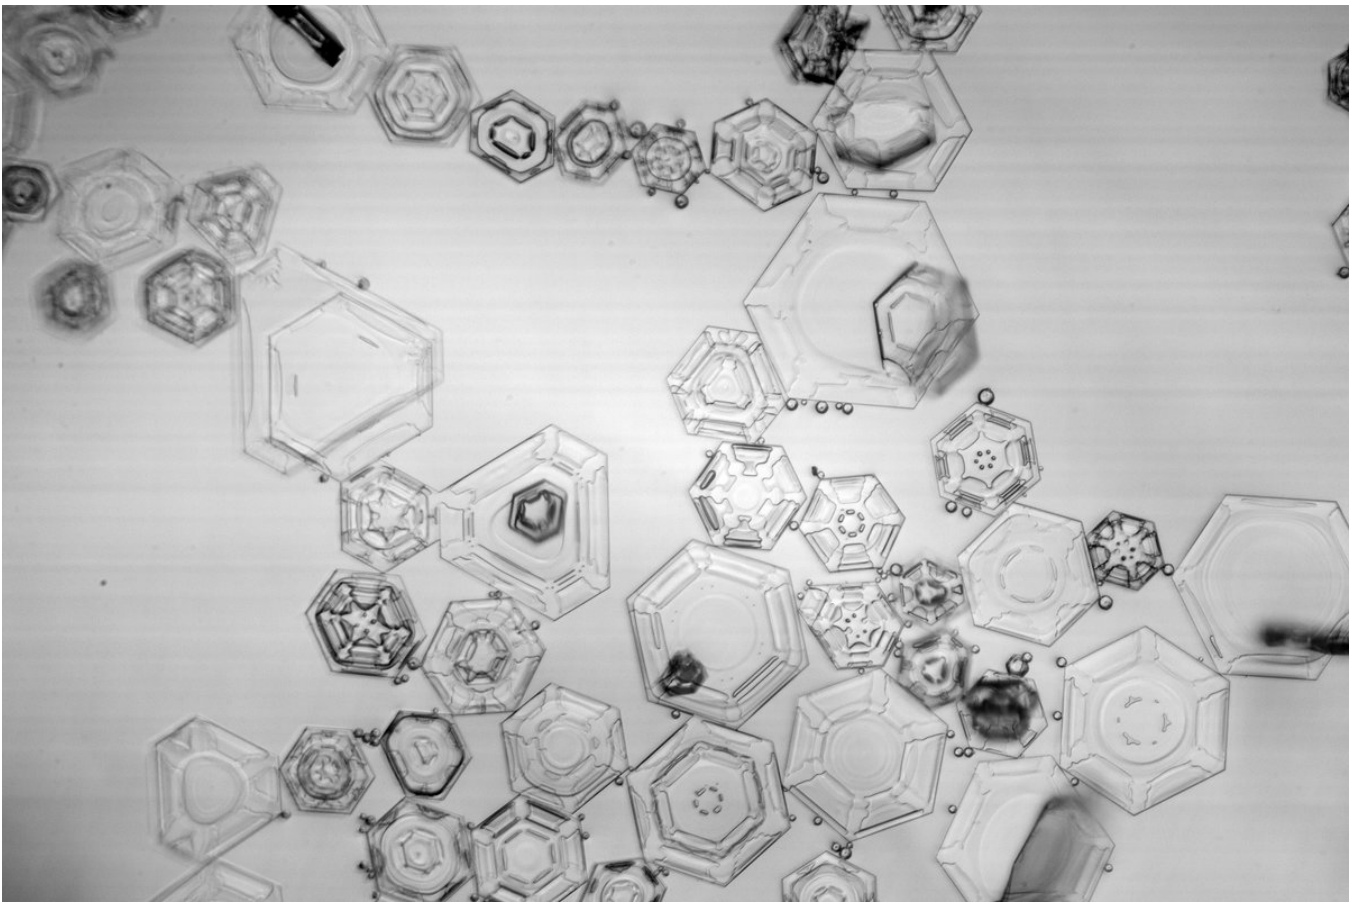

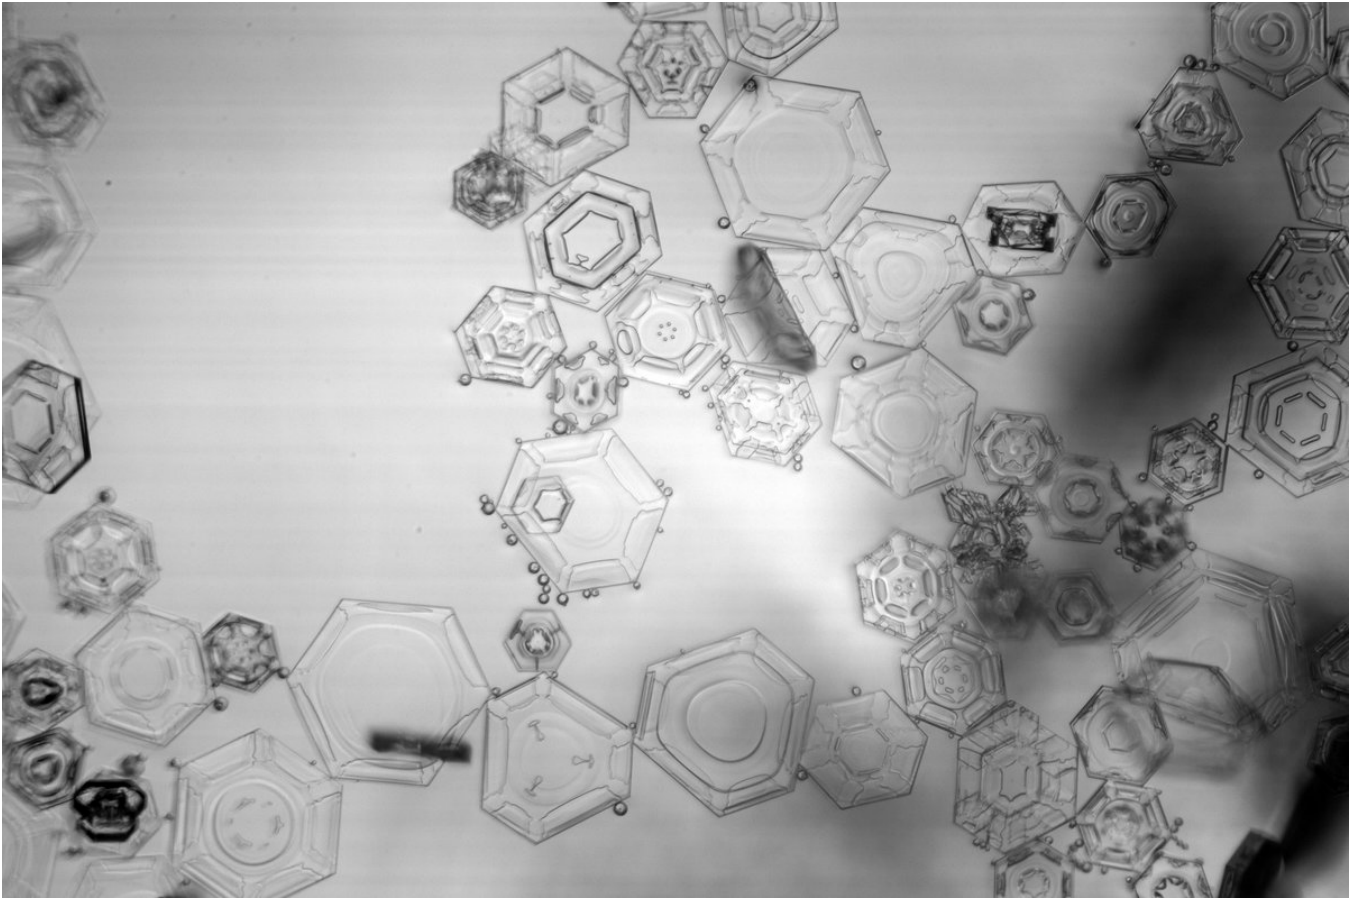

2/9 - 2023-12-08 15:01 UTC

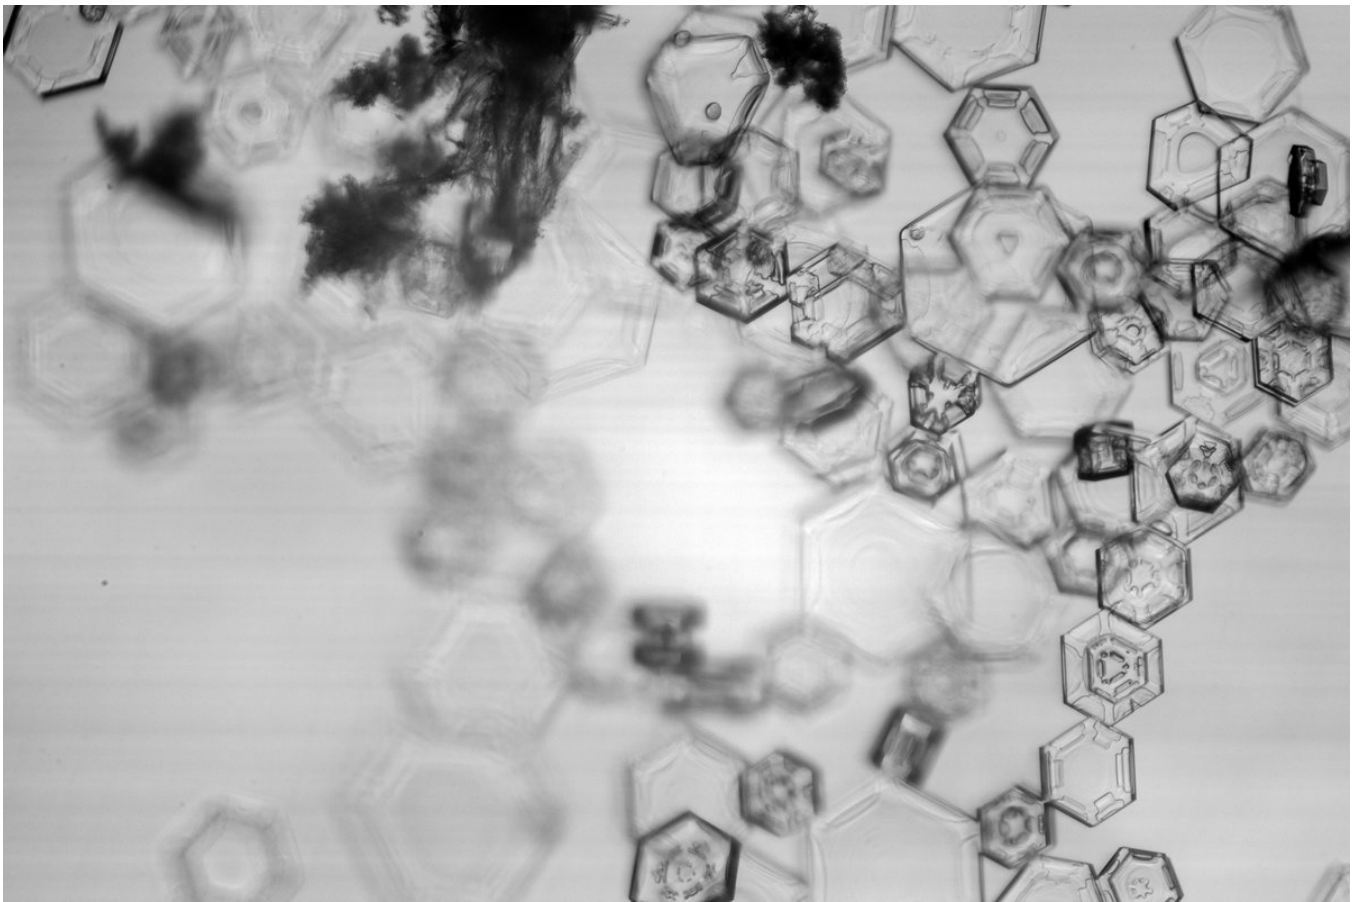

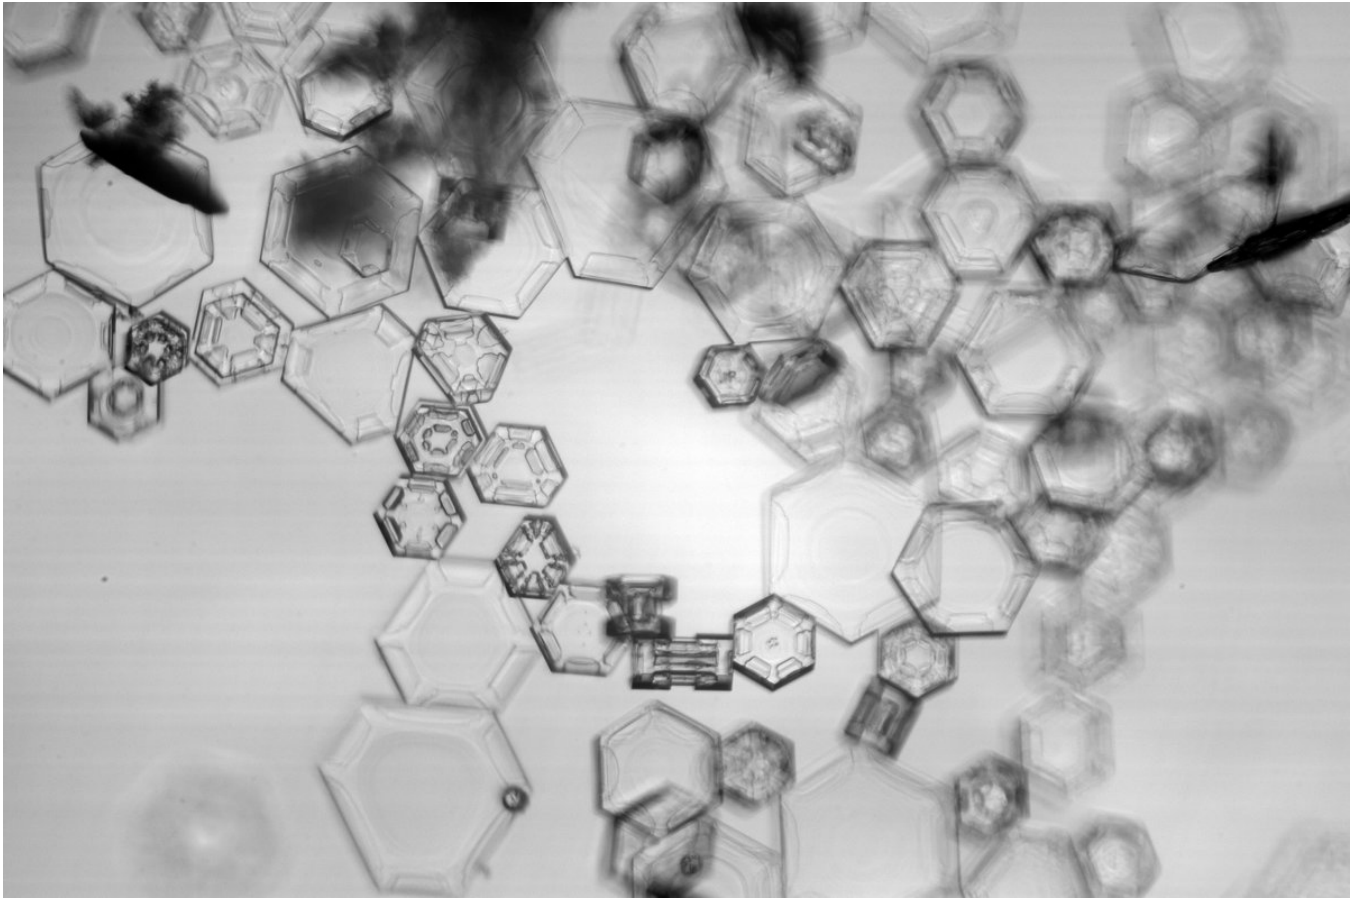

2023 Nov 20/21 - stage 4 and 5 - 4/9. Three more stage 4 crystal photos. Of course, as I said above, this was not a clean sample because it overlapped with stage 5.

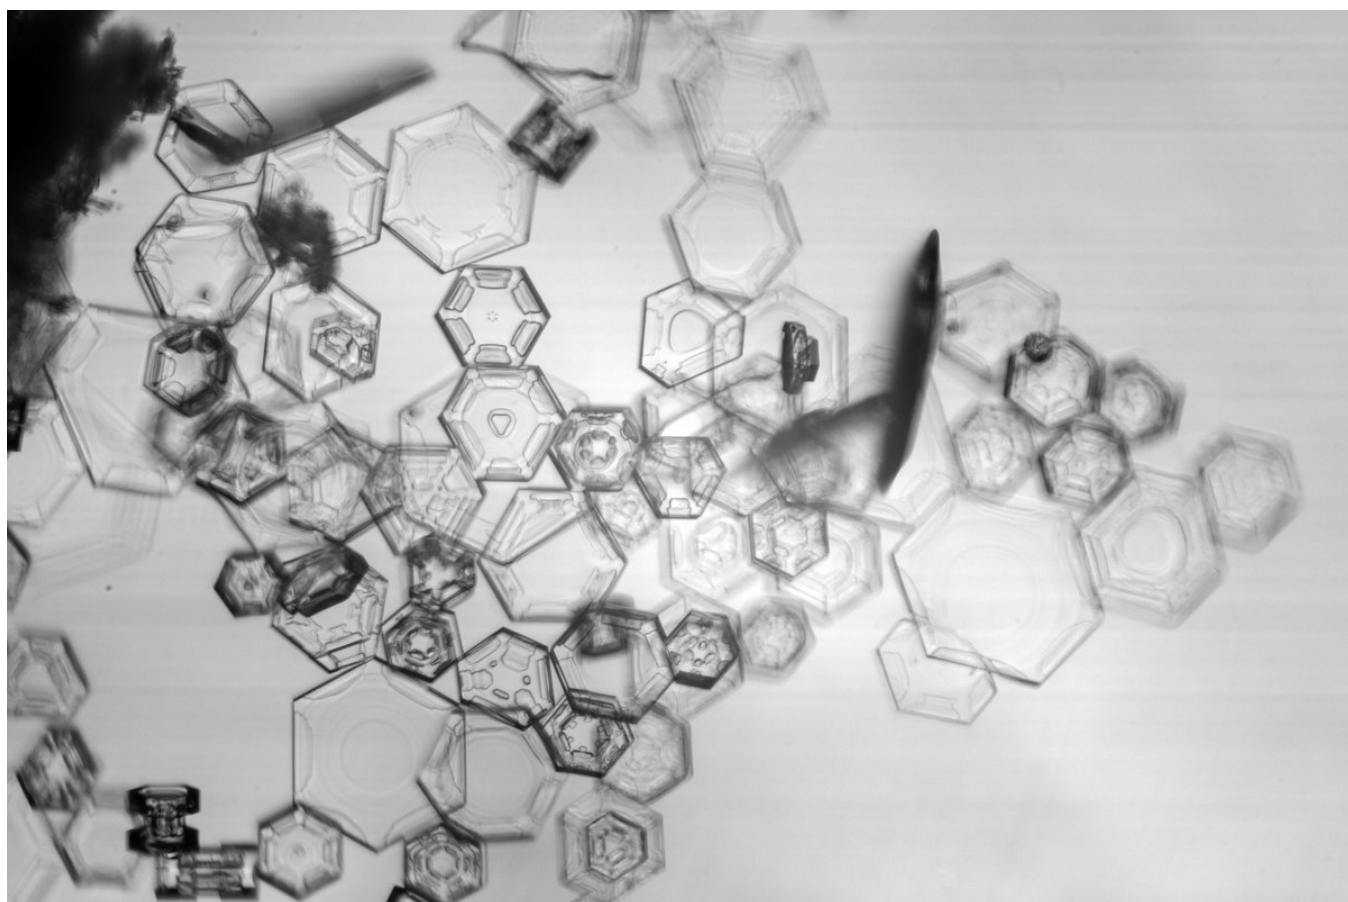

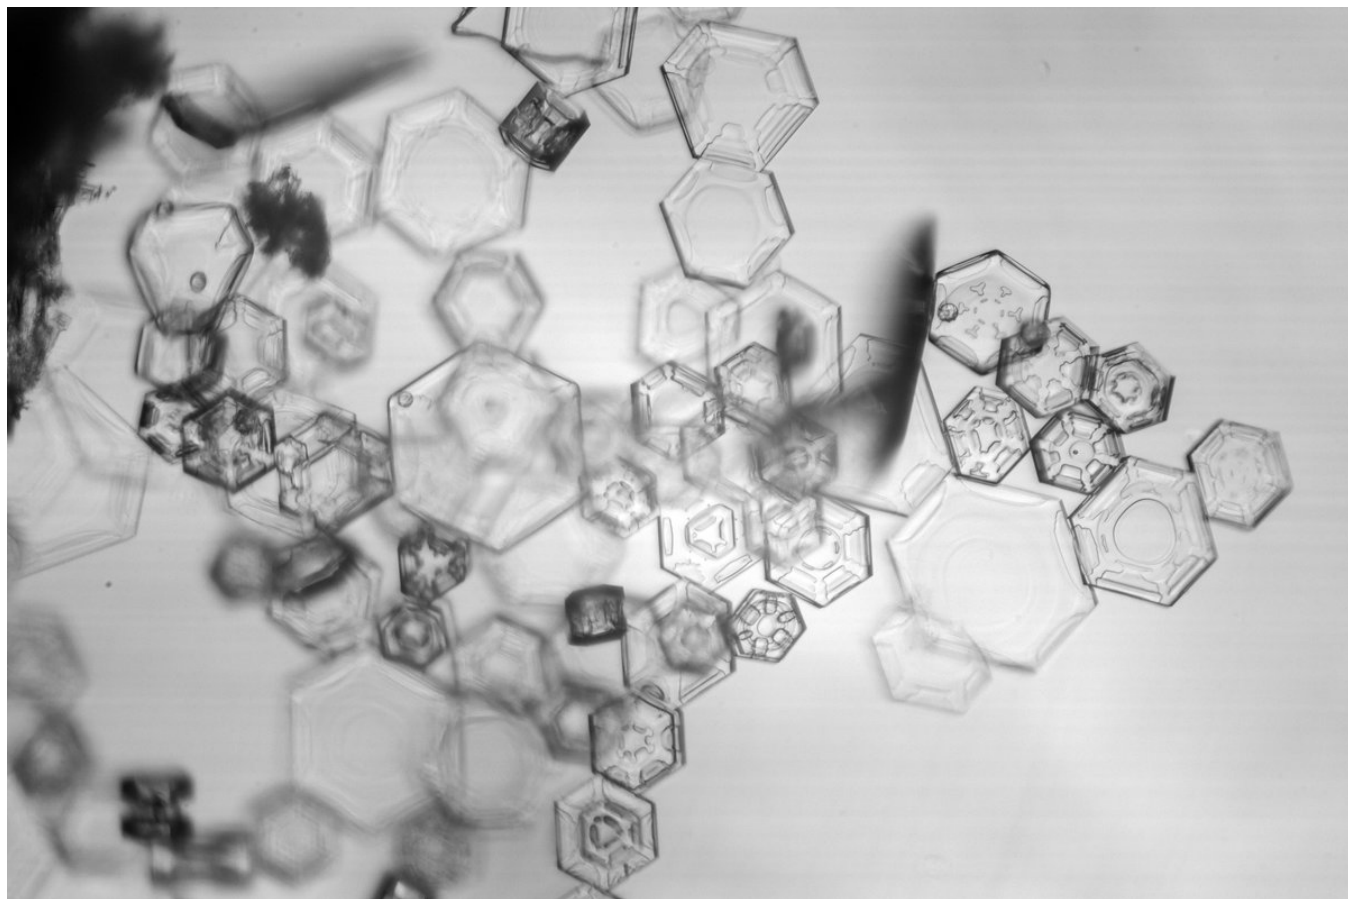

3/9 - 2023-12-08 15:03 UTC

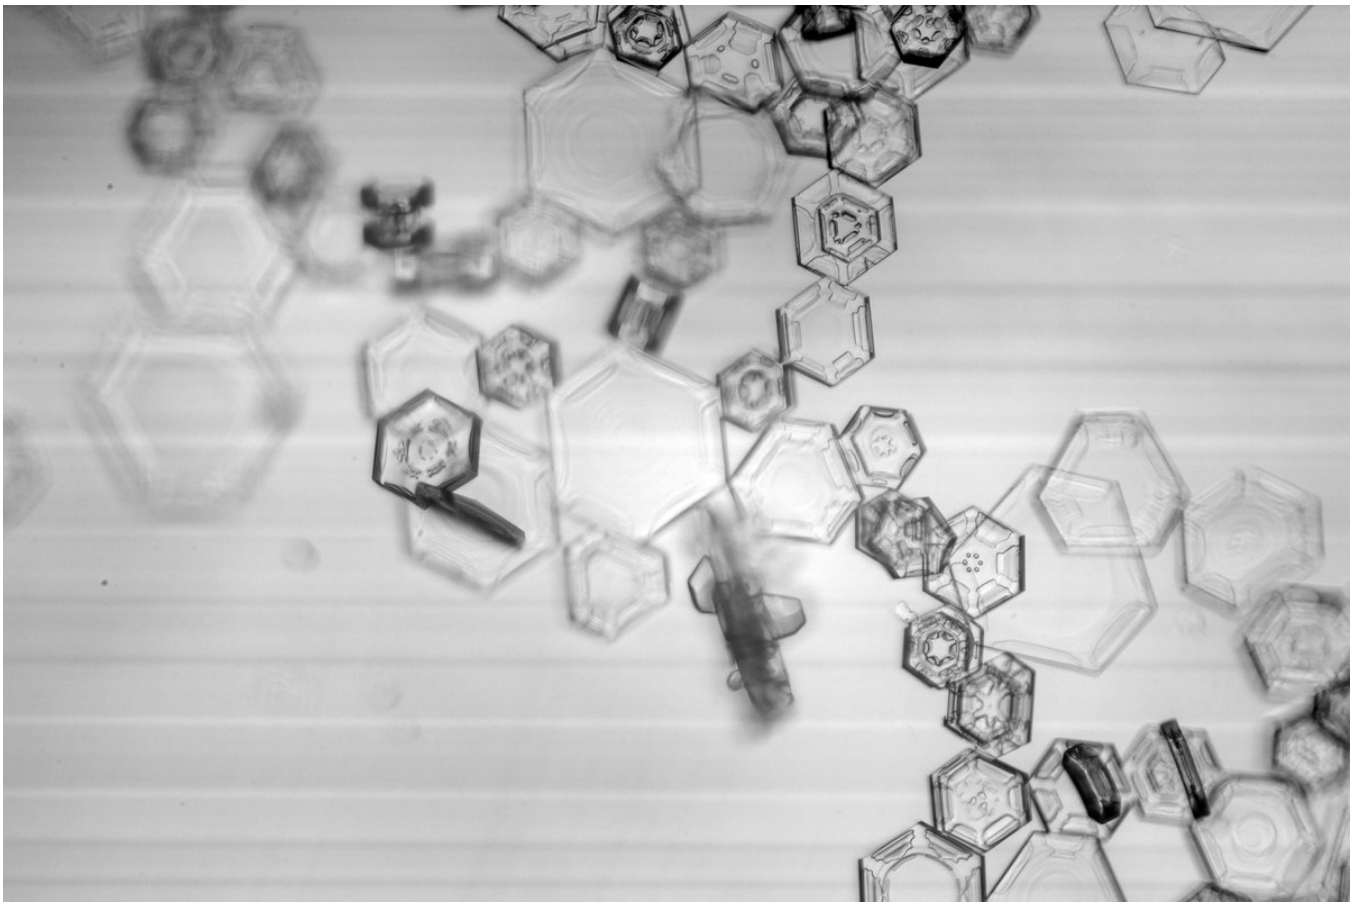

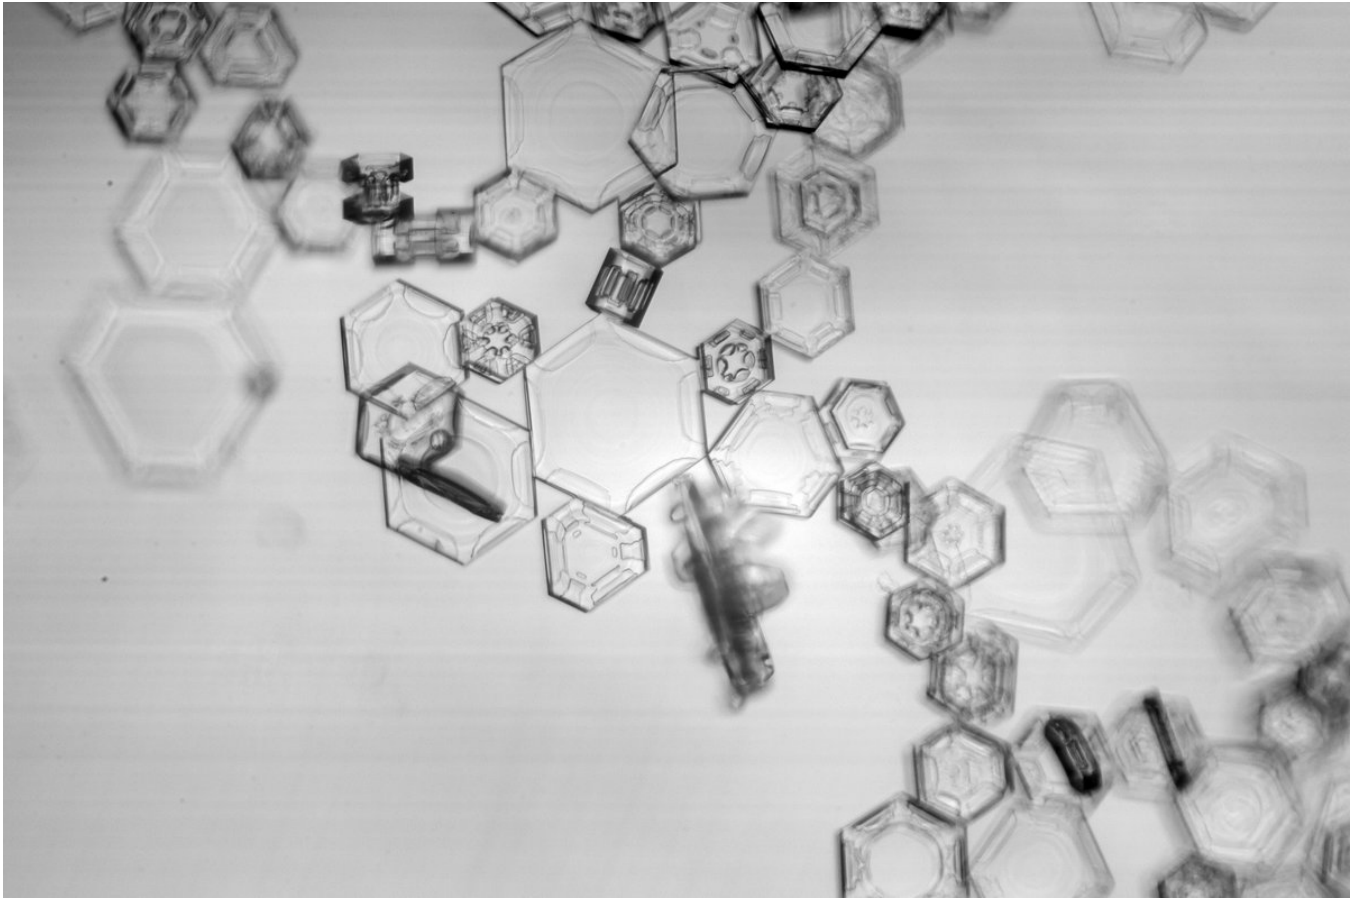

2023 Nov 20/21 - stage 4 and 5 - 5/9. This is stage 5 crystal photos of the anomalized countercircumnadir arc.

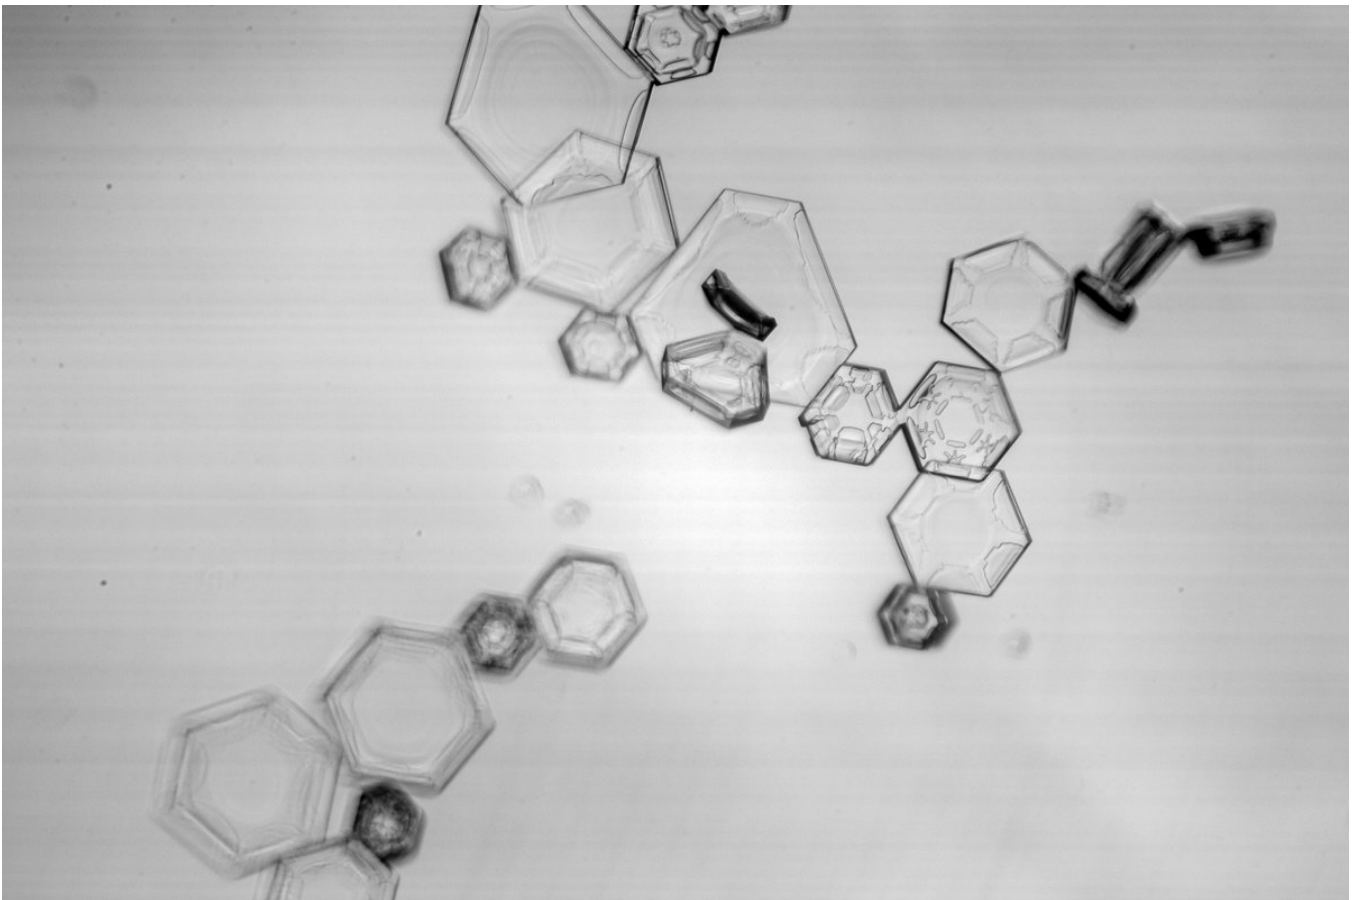

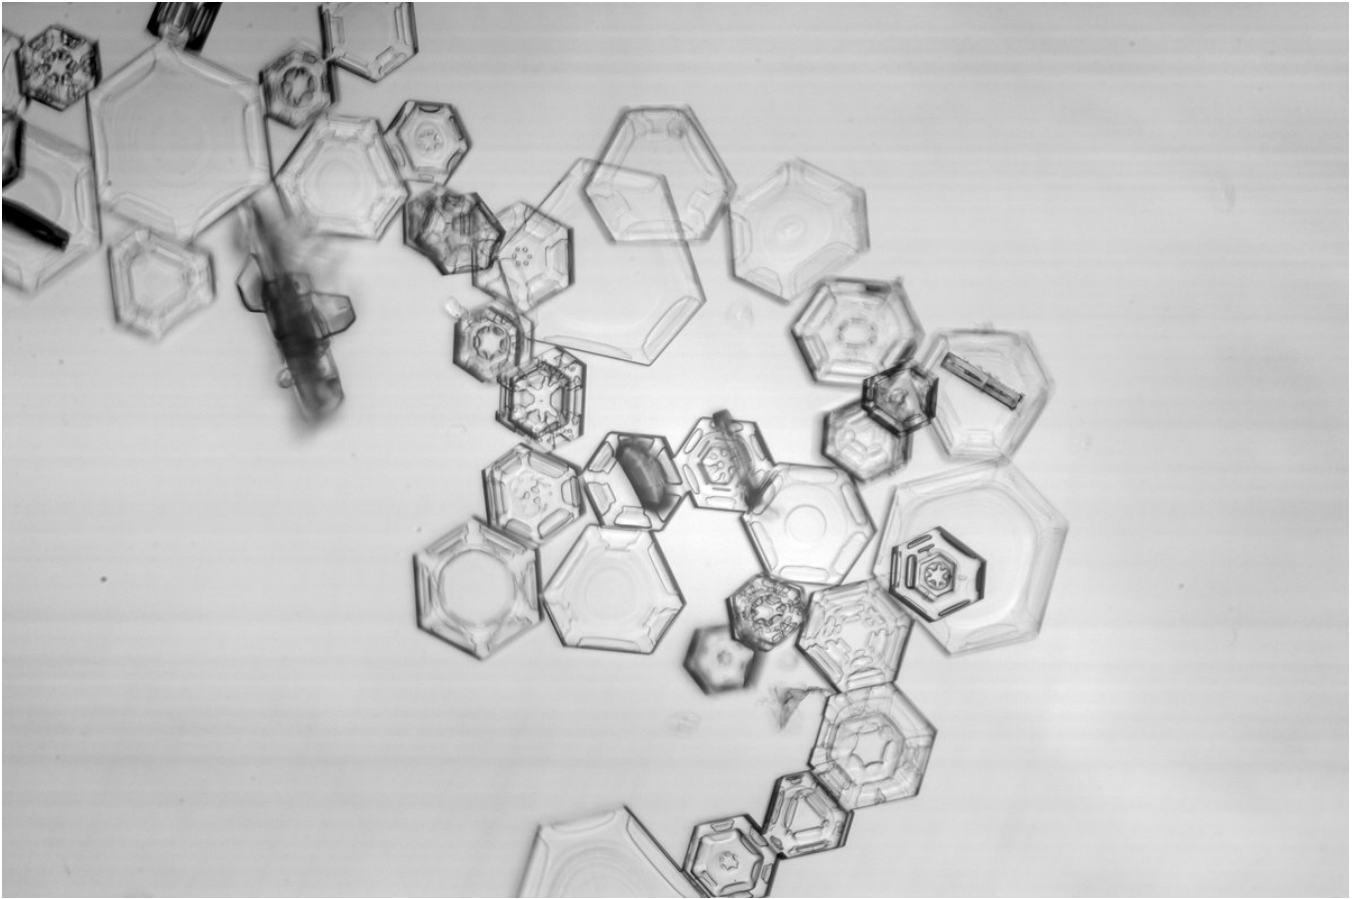

4/9 - 2023-12-08 15:05 UTC

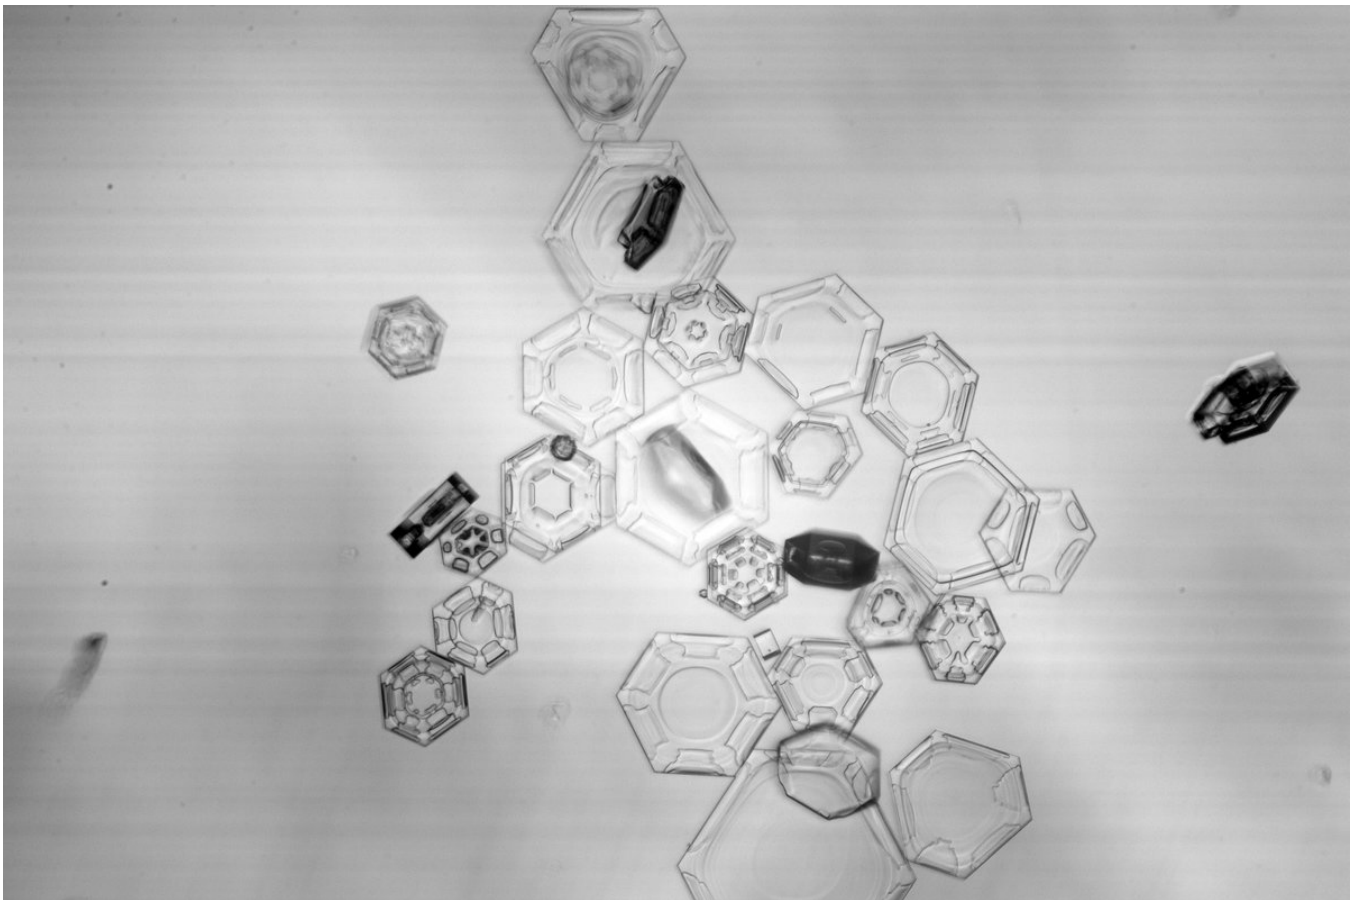

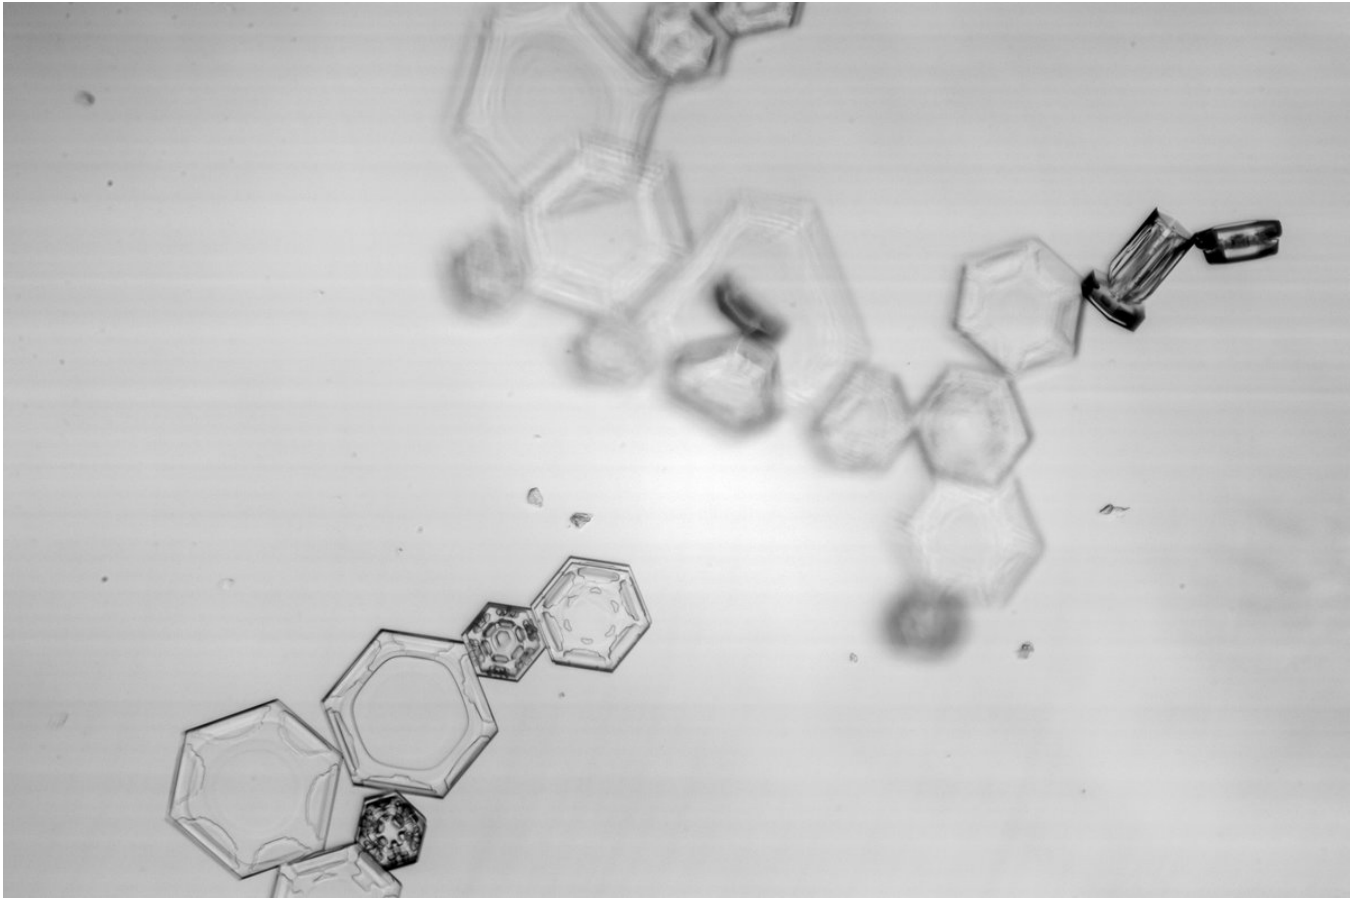

2023 Nov 20/21 - stage 4 and 5 - 6/9. More stage 5 crystals.

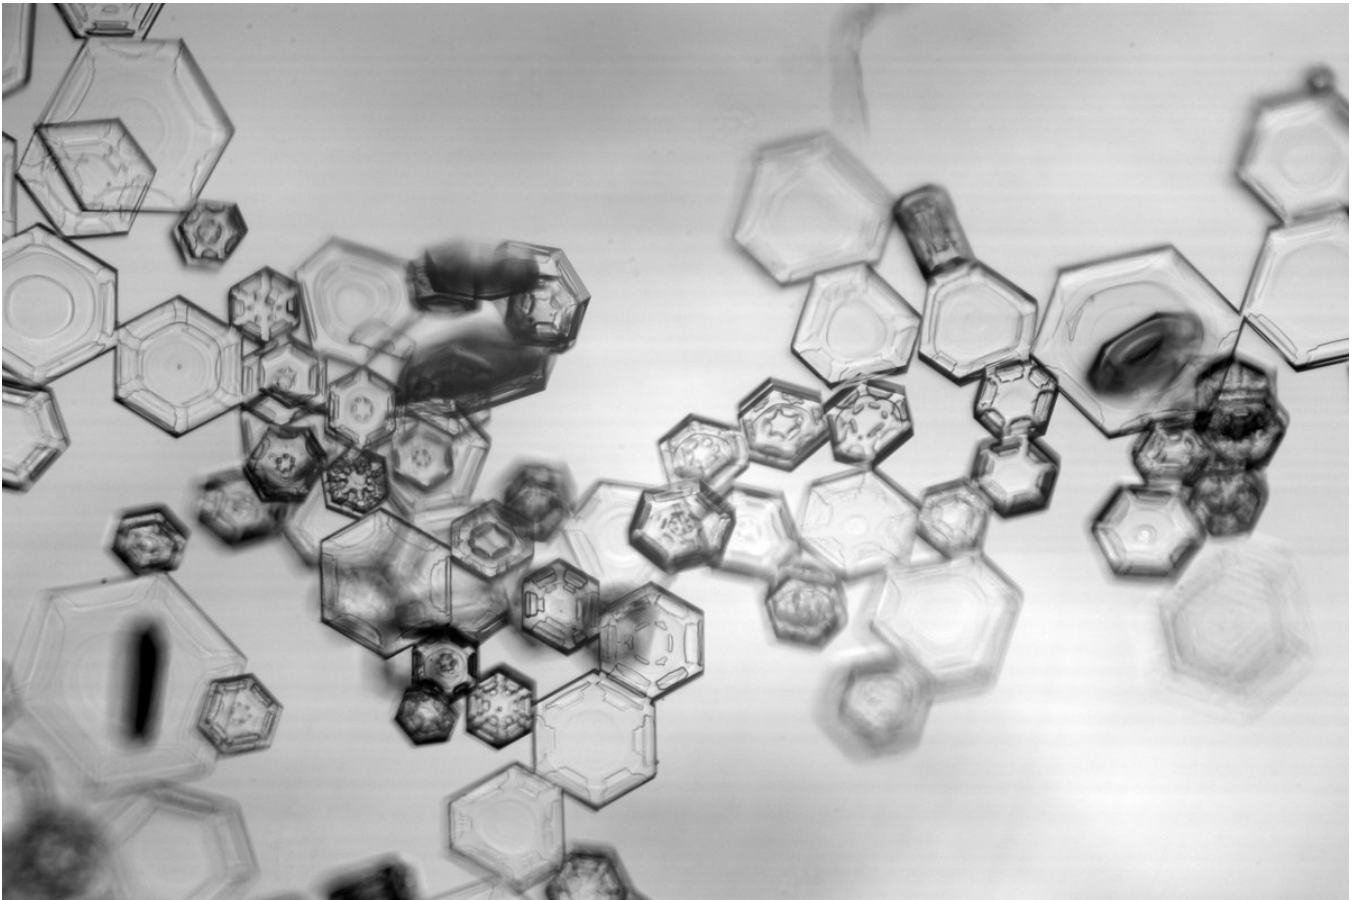

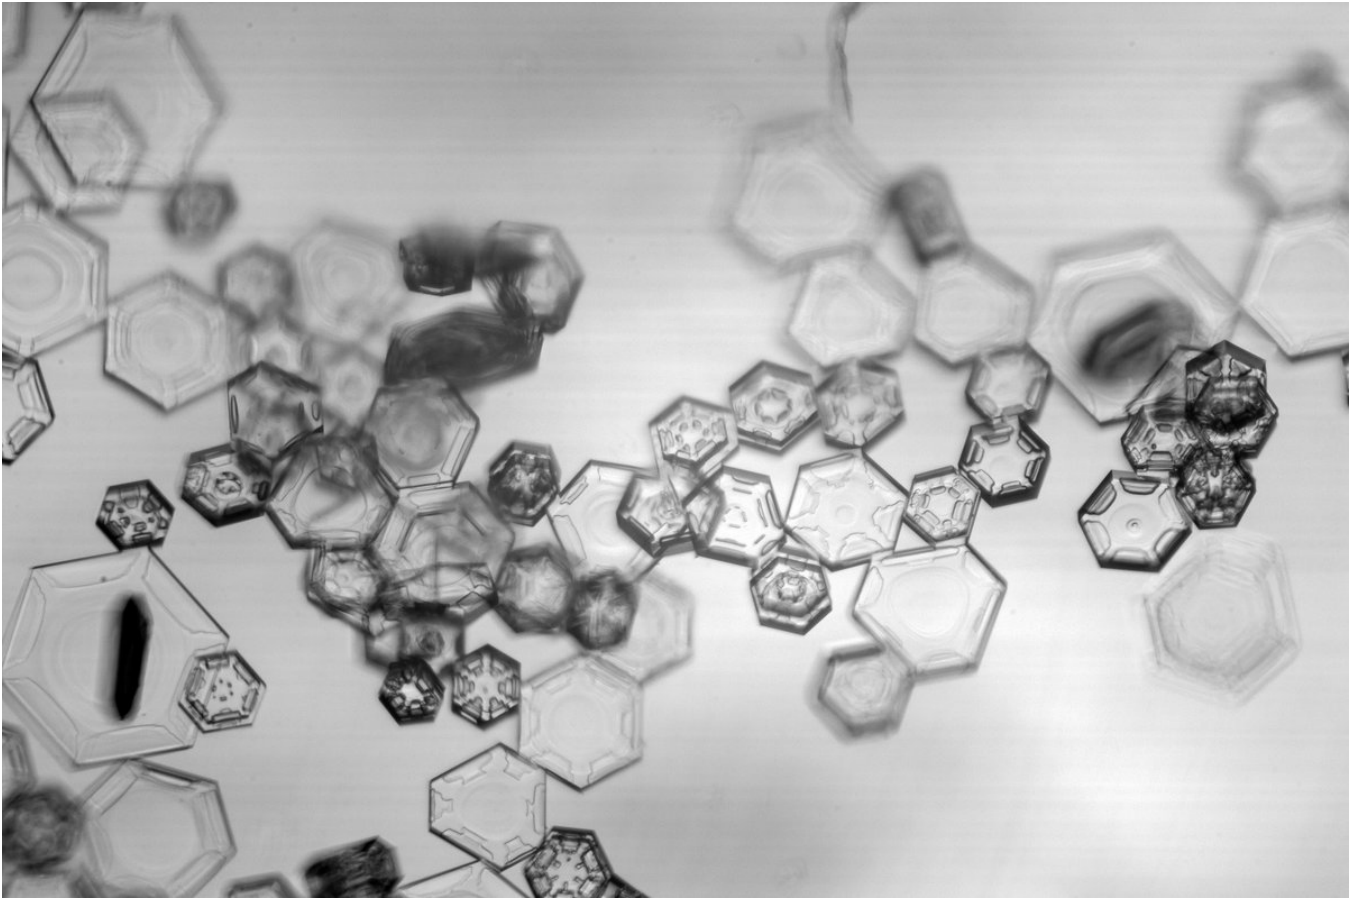

5/9 - 2023-12-08 15:07 UTC

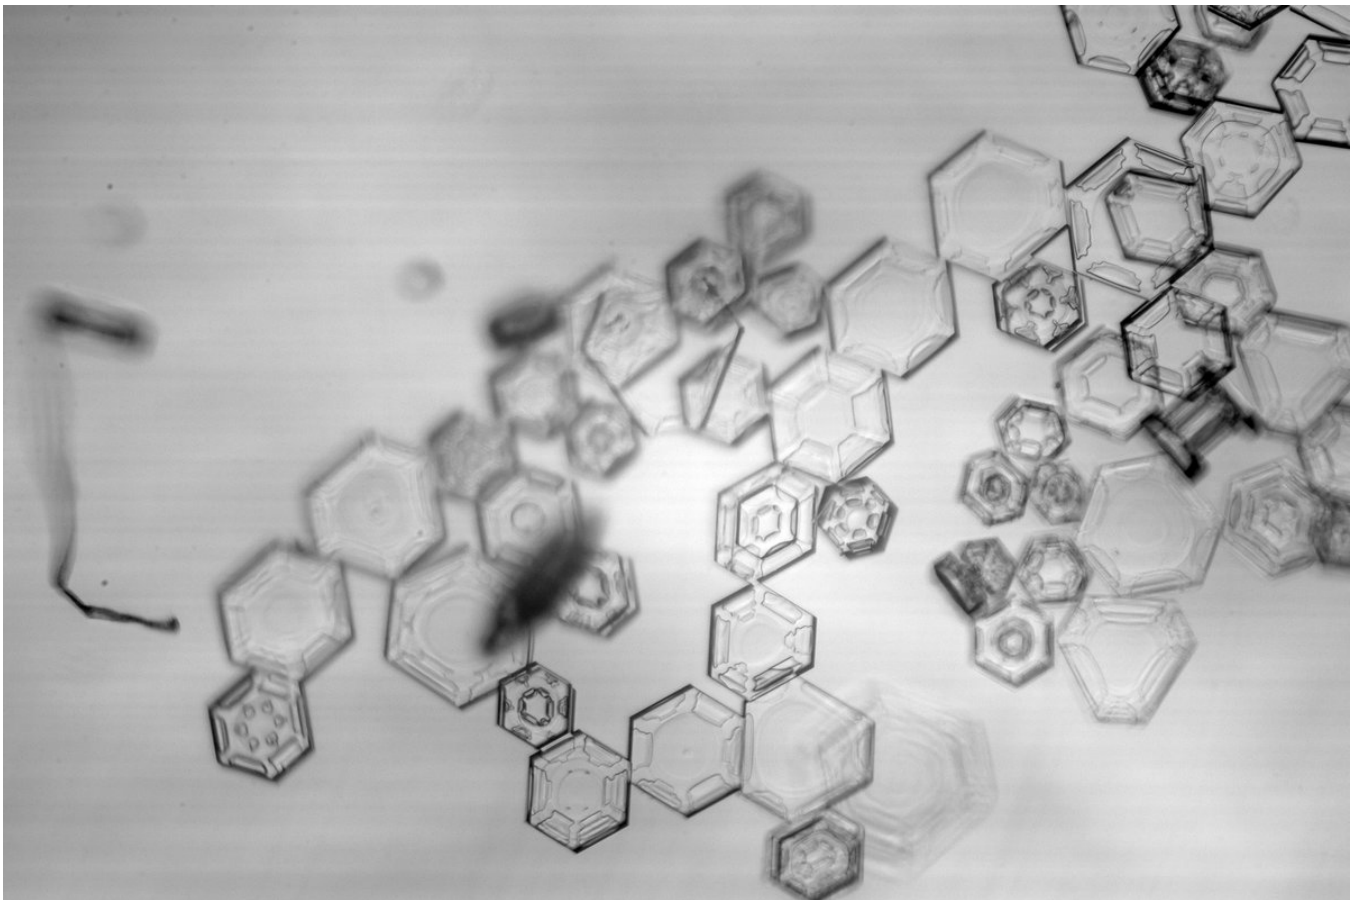

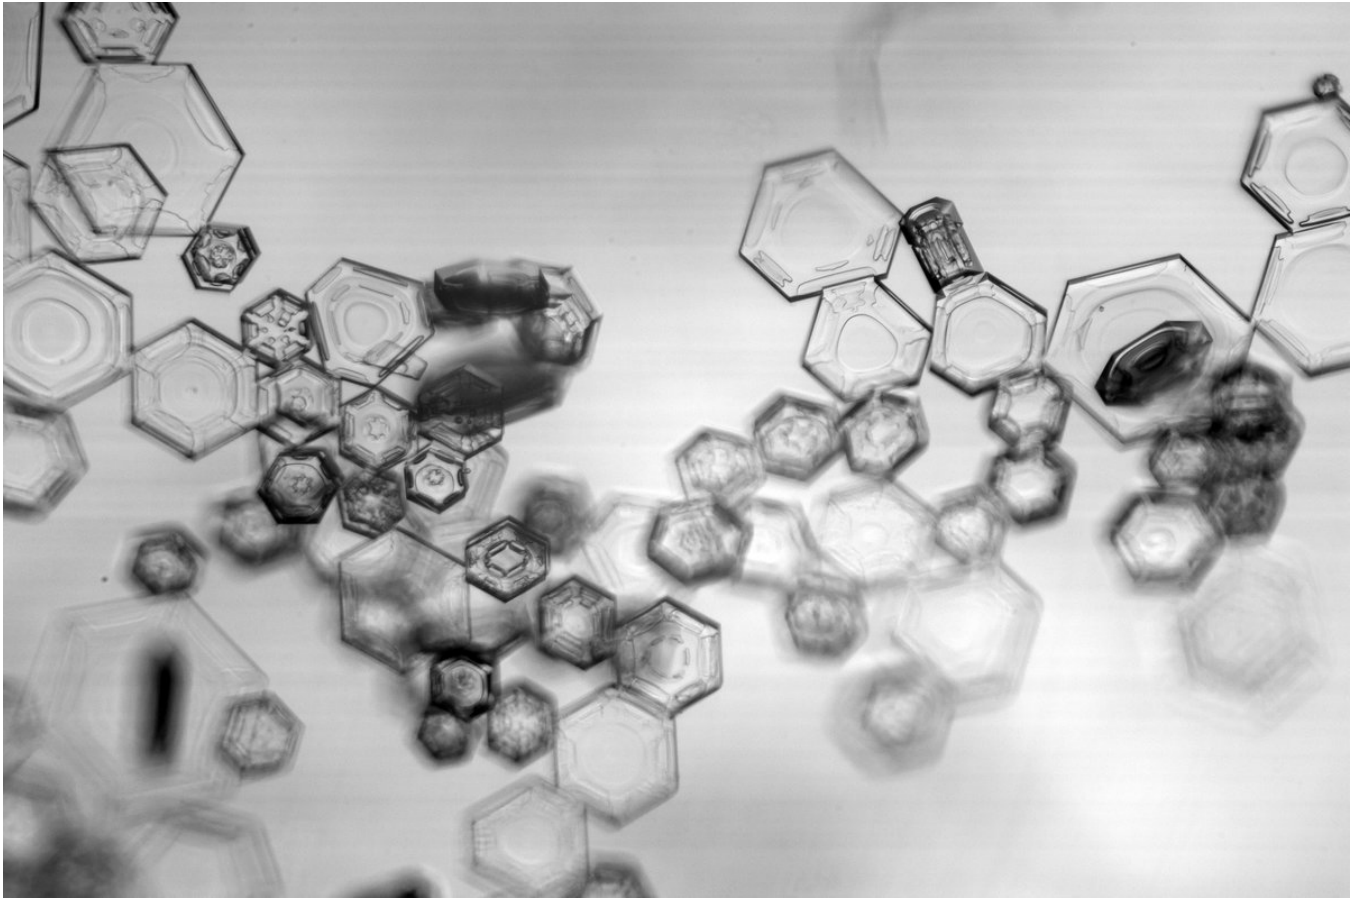

2023 Nov 20/21 - stage 4 and 5 - 7/9. More stage 5 crystals.

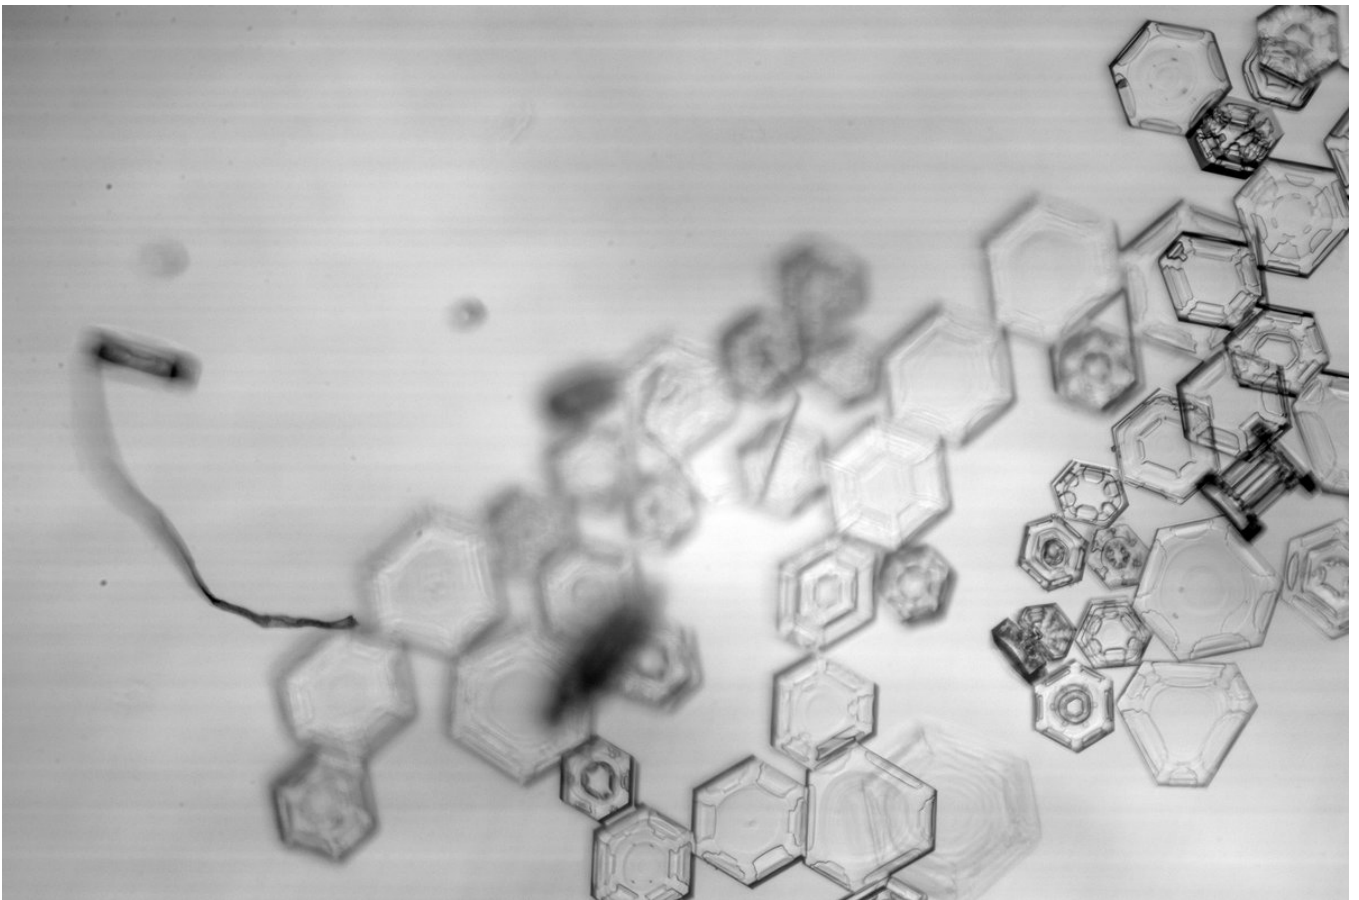

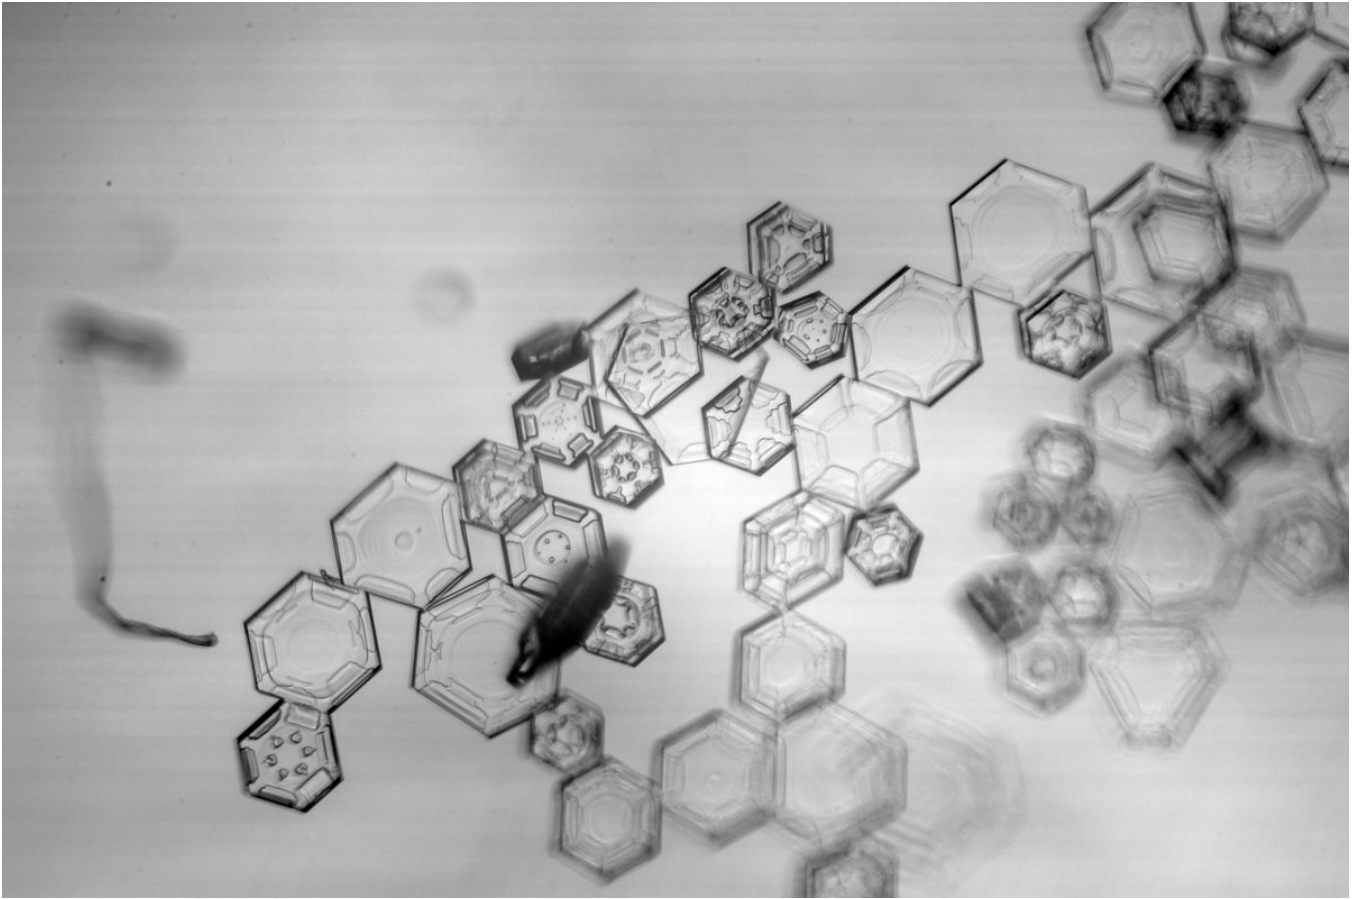

6/9 - 2023-12-08 15:09 UTC

2023 Nov 20/21 - stage 4 and 5 - 8/9. More stage 5 crystals.

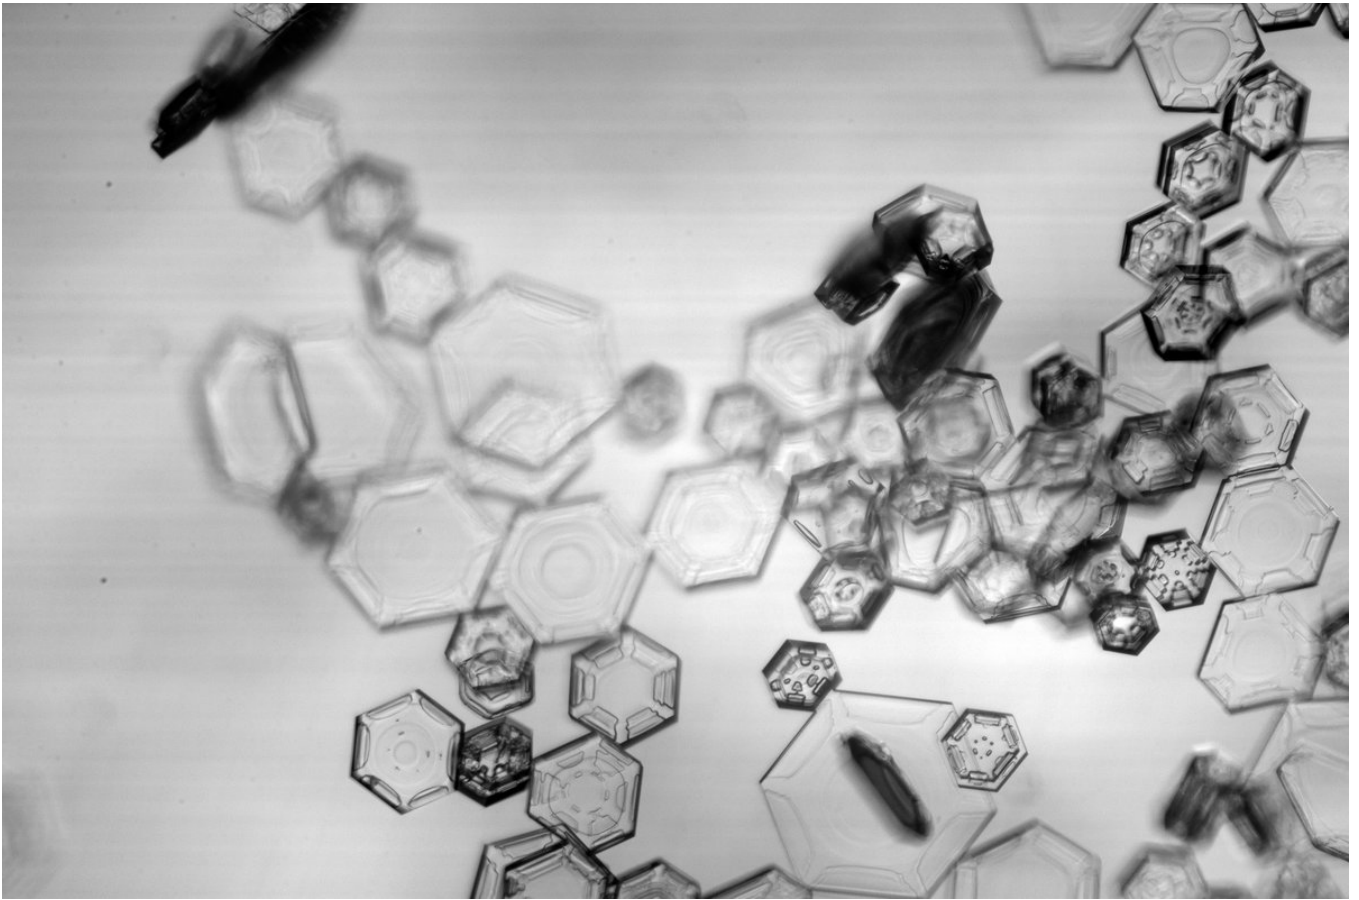

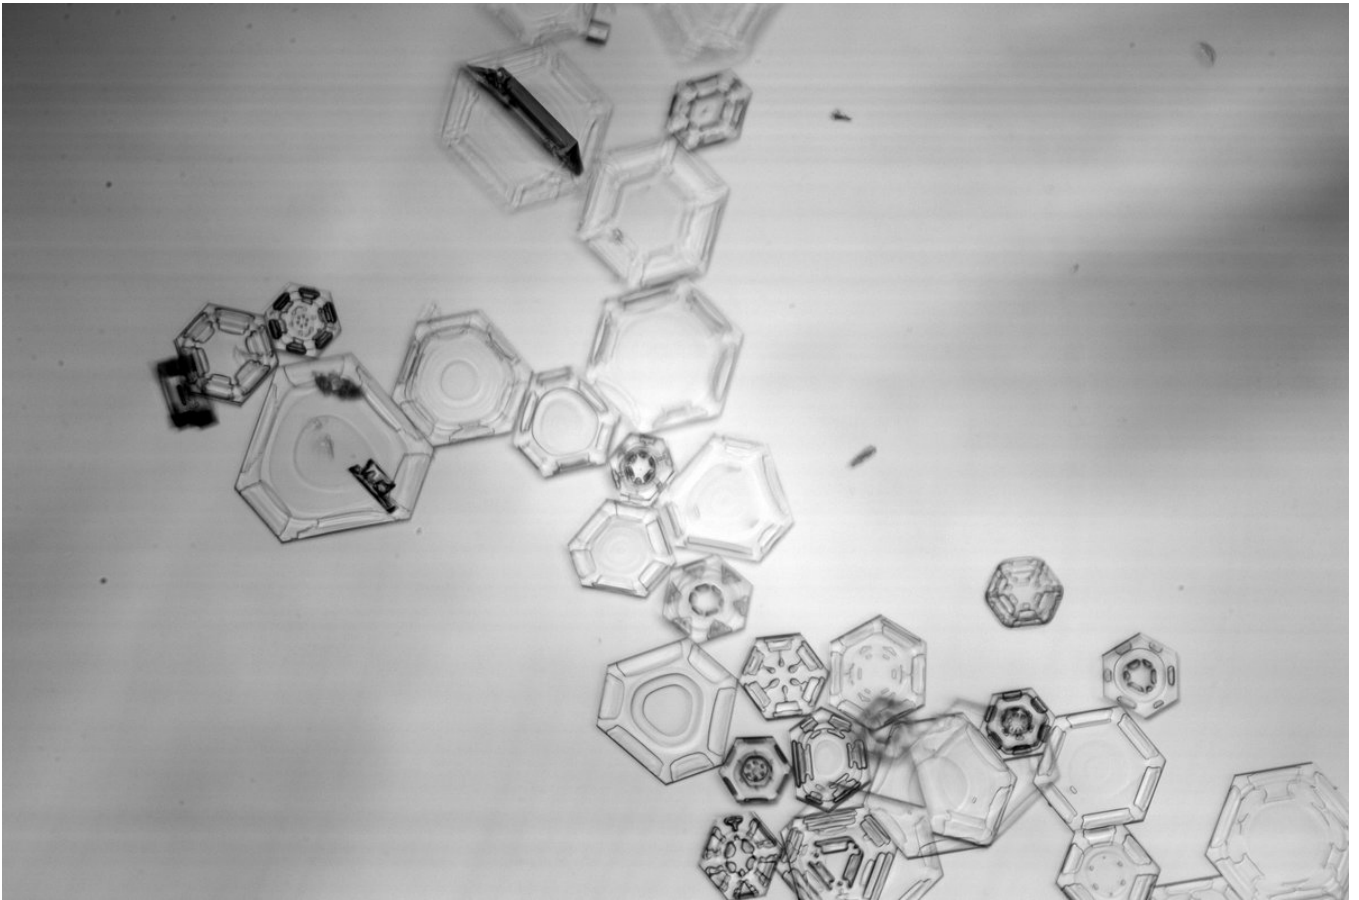

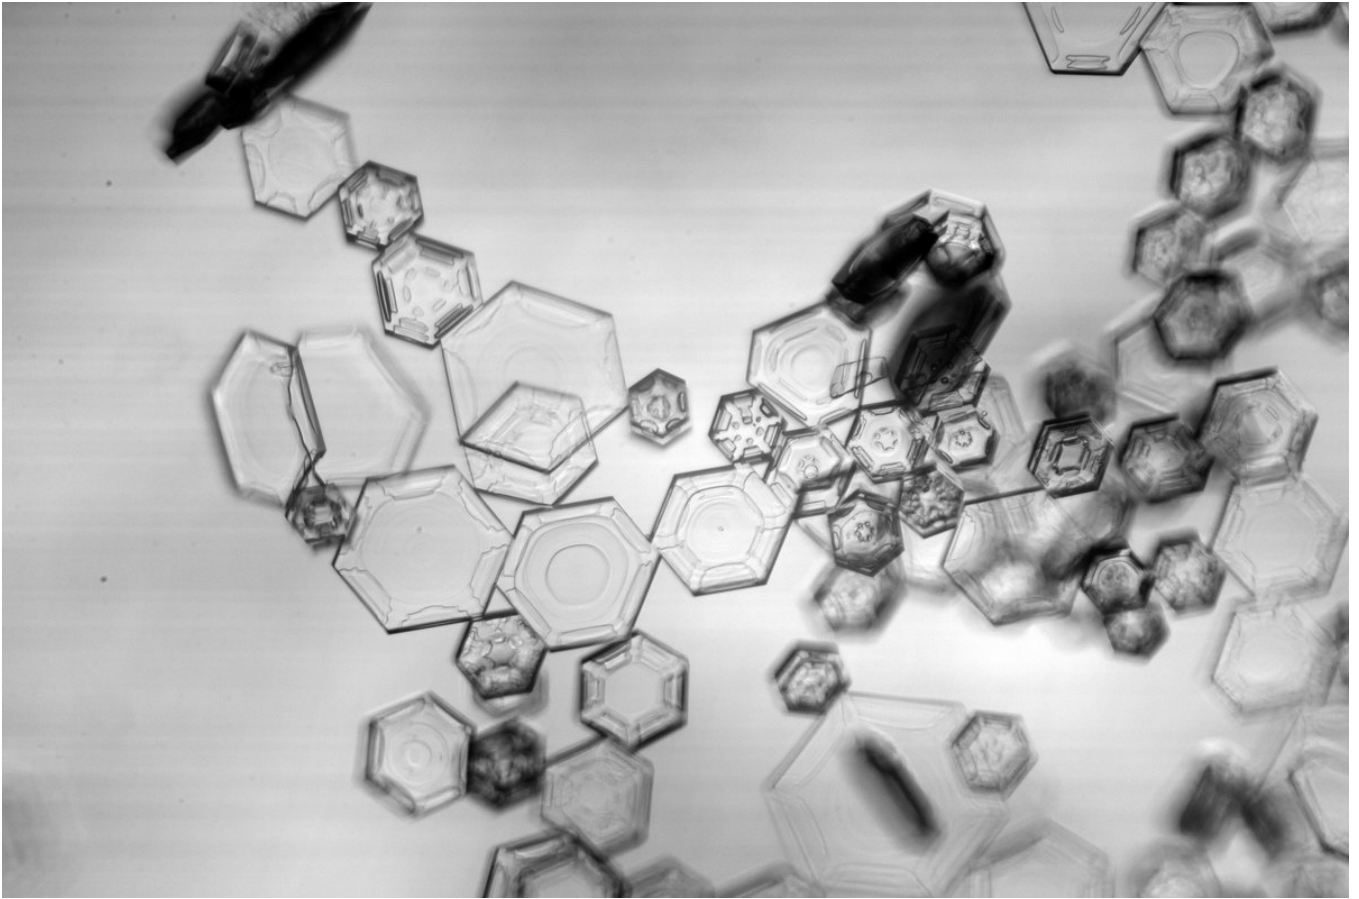

7/9 - 2023-12-08 15:17 UTC

2023 Nov 20/21 - stage 4 and 5 - 9/9. More stage 5 crystals. I can't see a fundamental difference in

the stage 4 and 5 samples. My head is empty as to the why the countercircumnadir arc shifted downwards.

Notice also the few columns in the samples. No column orientation halos whatsoever in the display, however.

8/9 - 2023-12-09 11:02 UTC

2023 Nov 20/21 - stage 4 and 5 - 10/9. A bonus post to this thread: video flashing the first and last

stack. Notice how the anomalous countercircumnadir arc is associated with a light sector that narrows down all the way to the lamp. It is reminiscent of an earlier display I photographed in 2016:

<https://t.co/3jPvAh974u>

But I don't think we are dealing in these displays with 46° contact arc as this feature starts above it's location. It's like the countercircumnadir arc is draining to the lamp.

Another thing to notice is of course the disappearance of countercircumnadir Kern when the ccna becomes anomalous. Also the dark eye inside ccna - ccnK is worth noting. I think we have seen at least suggestions of this feature in earlier displays.

9/9 - 2023-12-09 11:06 UTC

2023 Nov 20/21 - stage 4 and 5 - 11/9. This 13 frame stack from the beginning shows the ccna - ccnK dark void nicely. Simulations we have don't reproduce such feature.
