Yesterday evening, before visiting the slopes, I took time to document this weakest of arcs on the car roof which I interpret as counterparhelic (subparhelic) circle. It was visible only when viewed away from the lamp. In simulations counterparhelic circle is indeed strongest on the far side sky with the counter-Liljequist parhelia raypaths accounting for much of its brightness. (Apologies if this video doesn't work. I have tried reposting a couple of times. Works in preview but after posting something happens.)
