Snowpack stuff from 5/6 February 2024 night, Anttilanvaara, Rovaniemi. This is from the surface layer resting on top of a thin crust. Some crystals are also shown after which shown is another set from underneath that crust.

5/6 February 2024, Anttilanvaara, Rovaniemi. This is from below the crusted layer, just 10 frames

stacked. I have different sets from the deep, one was really poor. This one stood out so I publish it here. Plausibly I had hit upon some specific depth that had quality crystals. Maybe the very bottom. I didn't take sample, this was already in the near-twilight of a busy night. Would have really been something to get like 100 frame stack of this stuff.

5/6 February 2024, Anttilanvaara, Rovaniemi. A bonus pic. Max stack from a handful of select frames where the milky sheen was minimal.
