1/3 Elliptical halos in Tbilisi on three days in Sept 2022. I have published these already in Taivaanvahti. I saw none of these, camera was photographing by itself. ND 100 000 filter allowed long exposures. This one occurred 2 Sept. More info <https://www.taivaanvahti.fi/observations/show/117807>

2/3 - 2025-07-08 11:41 UTC

2/3. Next day, 3 Sept, another ellipse. More info: <https://taivaanvahti.fi/observations/show/117904>
There was an abundance Ac virga in Tbilisi in the summer. If that is indeed a fixed yearly feature, then I wager elliptical halo displays number there more than normal displays.

3/3 On September 21. <https://taivaanvahti.fi/observations/show/117920> I woke up late to

photographing those virgas. Started in late August when I had been there already from the beginning of June. By September virgas were already becoming less. Definitely worth a revisit to do it properly.
