3 related parhelic circle blue edges at 120° from each other: 33° , 87° and 153° . 35673 is the Liljequist parhelion blue edge, the segment is not concise because of non-regular hexagons. Probably a shorter raypath exists for 3567835. This feature is always masked by other rays.

Indeed, the 33° blue edge is possible from a shorter raypath in triangles. Another five-hit raypath makes the 153° blue edge. " 153° blue edge" is a better name over "Liljequist parhelia blue edge" because it can be seen even when Lilje parhelia can't due to non-regular hexagons.
