20/21 Nov 2025 Rovaniemi. In the trusted roaming ground of Anttilanvaara, a stack of 15 x 30s around 6 pm. It is more interesting than it looks. There is bit of a brightening on top of 22° halo, but nothing below. Is this rather a vex Parry arc than tanarc? I have more stacks coming. Some machines were working nearby on the other side of the railway, making disturbing pillars to the left of the left side flip-parhelion.

20/21 Nov 2025 Rovaniemi. In the next set (14 x 30s) I focused on the nadir arc, which nicely glittered against the ground at my feet. Although this halo is no-brainer, not much photos exists of it. That's because the Finnish tradition has been to do the "sky flipping trick" when light is below horizon, meaning the arc was regarded by the chasers just as zenith arc. Thus not much interest has been been spared on photographing its glitter low down against the restless ground. But the Finnish approach – one of whose chief purveyors I have been – is wrong. No sky-flipping should be performed, as Tape has already argued in the past. The arc in this image is as independent halo in its own right as the zenith arc is.

20/21 Nov 2025 Rovaniemi. The display had crapped already and I tried a little lower lamp before leaving (20 x 30s). But the very best stage of this display with flip-120° parhelion is still to come. I just don't have the photos with me until tomorrow because I left the camera behind in one place that is closed for the weekend.

20/21 Nov 2025 Rovaniemi. 16 x 30s. A sideview of the best stage showing upper flip-120° parhelion. I didn't pay attention to it visually. Mikkilä's Soul was present now and then, too, maybe it is visible in this stack as well. Is there a helic arc? In two parts – a short segment from the lamp and longer segment crossing the upper flip-parhelic circle. I will see what simulation says.
