29/30 Jan 2026. So here we are with the dilemma I brought up in an earlier post. Car is growing a display but there is ice fog to be had out there as we speak (Apukka -27.4 C). Wait or go? The windows are coming always slower than the roof, in the rear window there is incipient growth, but I think it is still quite long off to have a proper display. I opened the front door windows some to let the interior cool faster to try accelerate the frosting. This may be deleterious, though, I think I have previously gotten the inner glass surfaces fogged by trying.

Anyway, if it is only basic plate and Parry, as it seems now, we have seen that already. So I guess might be better to hit the road.

I leave here a note also of last night, which was snowing all through. But despite this, it was interspersed with diamond dust from the ski center – pillars were visible for hours in my neighborhood, even in a quite thick snowfall.

29/30 Jan 2026, Rovaniemi. There were actually two ellipses (for background, see <https://t.co/Y08qL0pvHZ>). On this video their bottom parts are showing up vaguely. I have different views showing one ellipse or both, also with phone. The arc at the very bottom is deepcave Parry. Not sure if odd radius was involved, in one video there are spots that could be 24° plate arcs, meaning deepcave 23° plate arc could also contribute.

The frost crystals were kind of blade/needle like, some snowstars also from the sky. I have placed an order for a phone clip microscope on the off-chance that it would actually be useful. No doubt these ellipses are a common occurrence.

29/30 Jan 2026, Rovaniemi. Lamp inside the car on top of the front seat backrest. Two elliptical halos and shallowcave Parry. The larger ellipse is not visible on the right side.

4/7 - 2026-01-31 13:53 UTC

29/30 Jan 2026, Rovaniemi. The best video of the spots above parhelia, apparent 24° plate arcs. Also a single elliptical halo is visible, but now I wonder if 9° column arc is an option. Some concentration of light above the lamp, which I take is vex Parry, better visible in some other videos that show also Tape arcs. However, 24° plate arcs should enable also 20° plate arc, which is a similar V-shape below Parry. If I look with the eye of faith, maybe the light concentration is actually made of two arcs.

5/7 - 2026-01-31 14:18 UTC

29/30 Jan 2026, Rovaniemi. Phone view of the bottom parts of the two ellipses. Frustratingly indistinct. Visually is just saw something broad below the lamp. I am wondering if 9° plate arc could be involved.

6/7 - 2026-01-31 14:45 UTC

29/30 Jan 2026, Rovaniemi. The ostensible vex Parry well visible here as V-shape. But is there one or two arcs? The supposed 24° plate arcs are seen, too. Something extends from them. Helic arc would fit the bill, both normal and pyramid.

7/7 - 2026-01-31 15:10 UTC

29/30 Jan 2026, Rovaniemi. One more view. I am walking back from what I earlier said about Tape arcs being visible in other videos. I am not seeing them confidently here. So the contribution of Parry vs odd radius plate is left somewhat hanging in the air here.
