23/24 Feb 2026, Rovaniemi. Left around 7 pm but had to wait for the ice fog to take over. Before that, there was only intermittent action in the vicinity of the gun, as shown here. This time, Liljequist arcs exhibit the "split spectrum" <https://t.co/W7arGkb2MG>, which is one of the many mysterious aspects of these arcs.

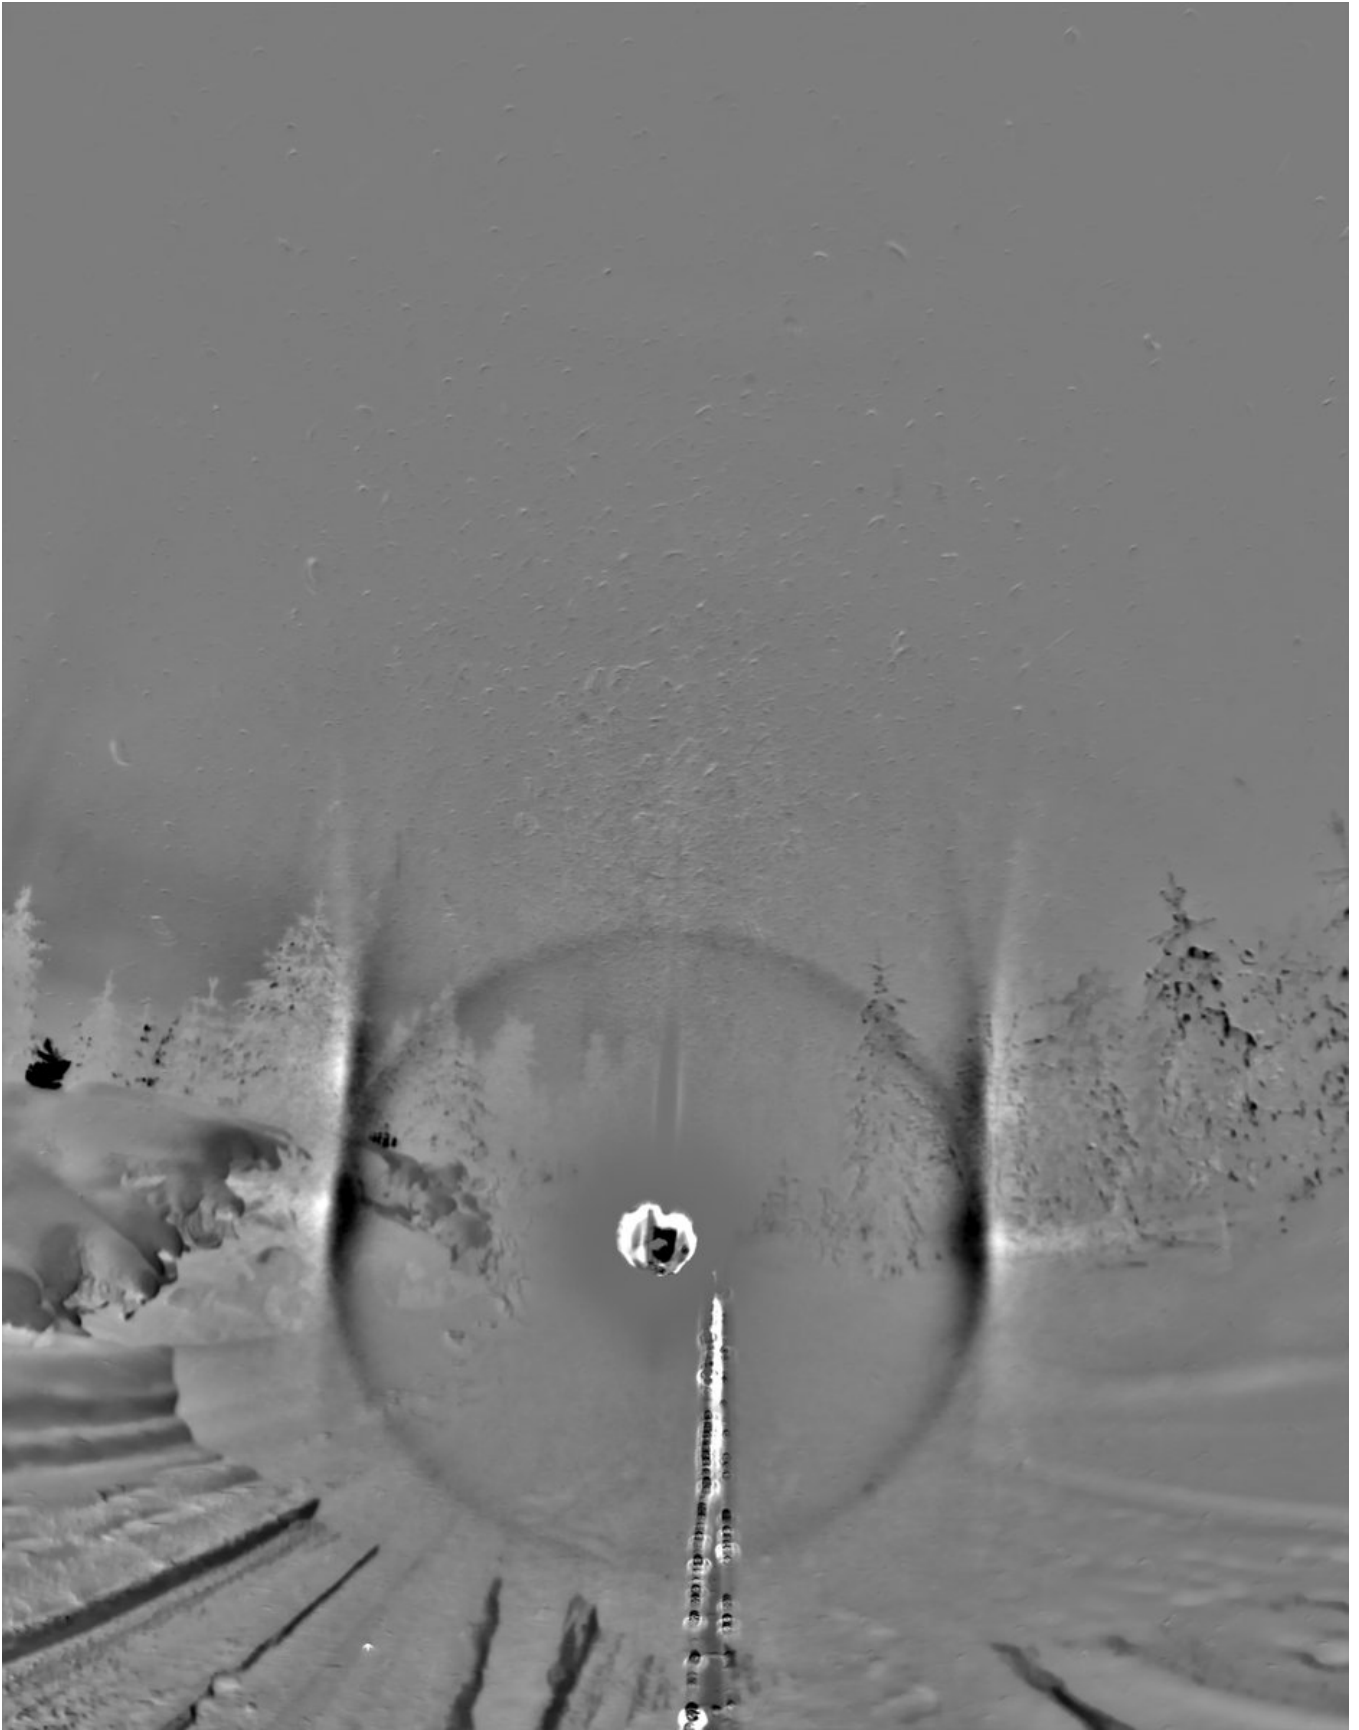

Once ice fog took over, it happened at the turn of a switch – suddenly large areas towards east, that had just a moment ago been completely clear, were enshrouded. I took photos and crystals in one location, but the display was really poor. Went further east to the Jokkavaara gravel pits, however, the action had not yet reached there. Waited for a while, but felt worn out and started towards the city and the apartment. Of course I should have persevered: as I drove back, the ice fog had crept further east and was just around the corner. Car -25 C.

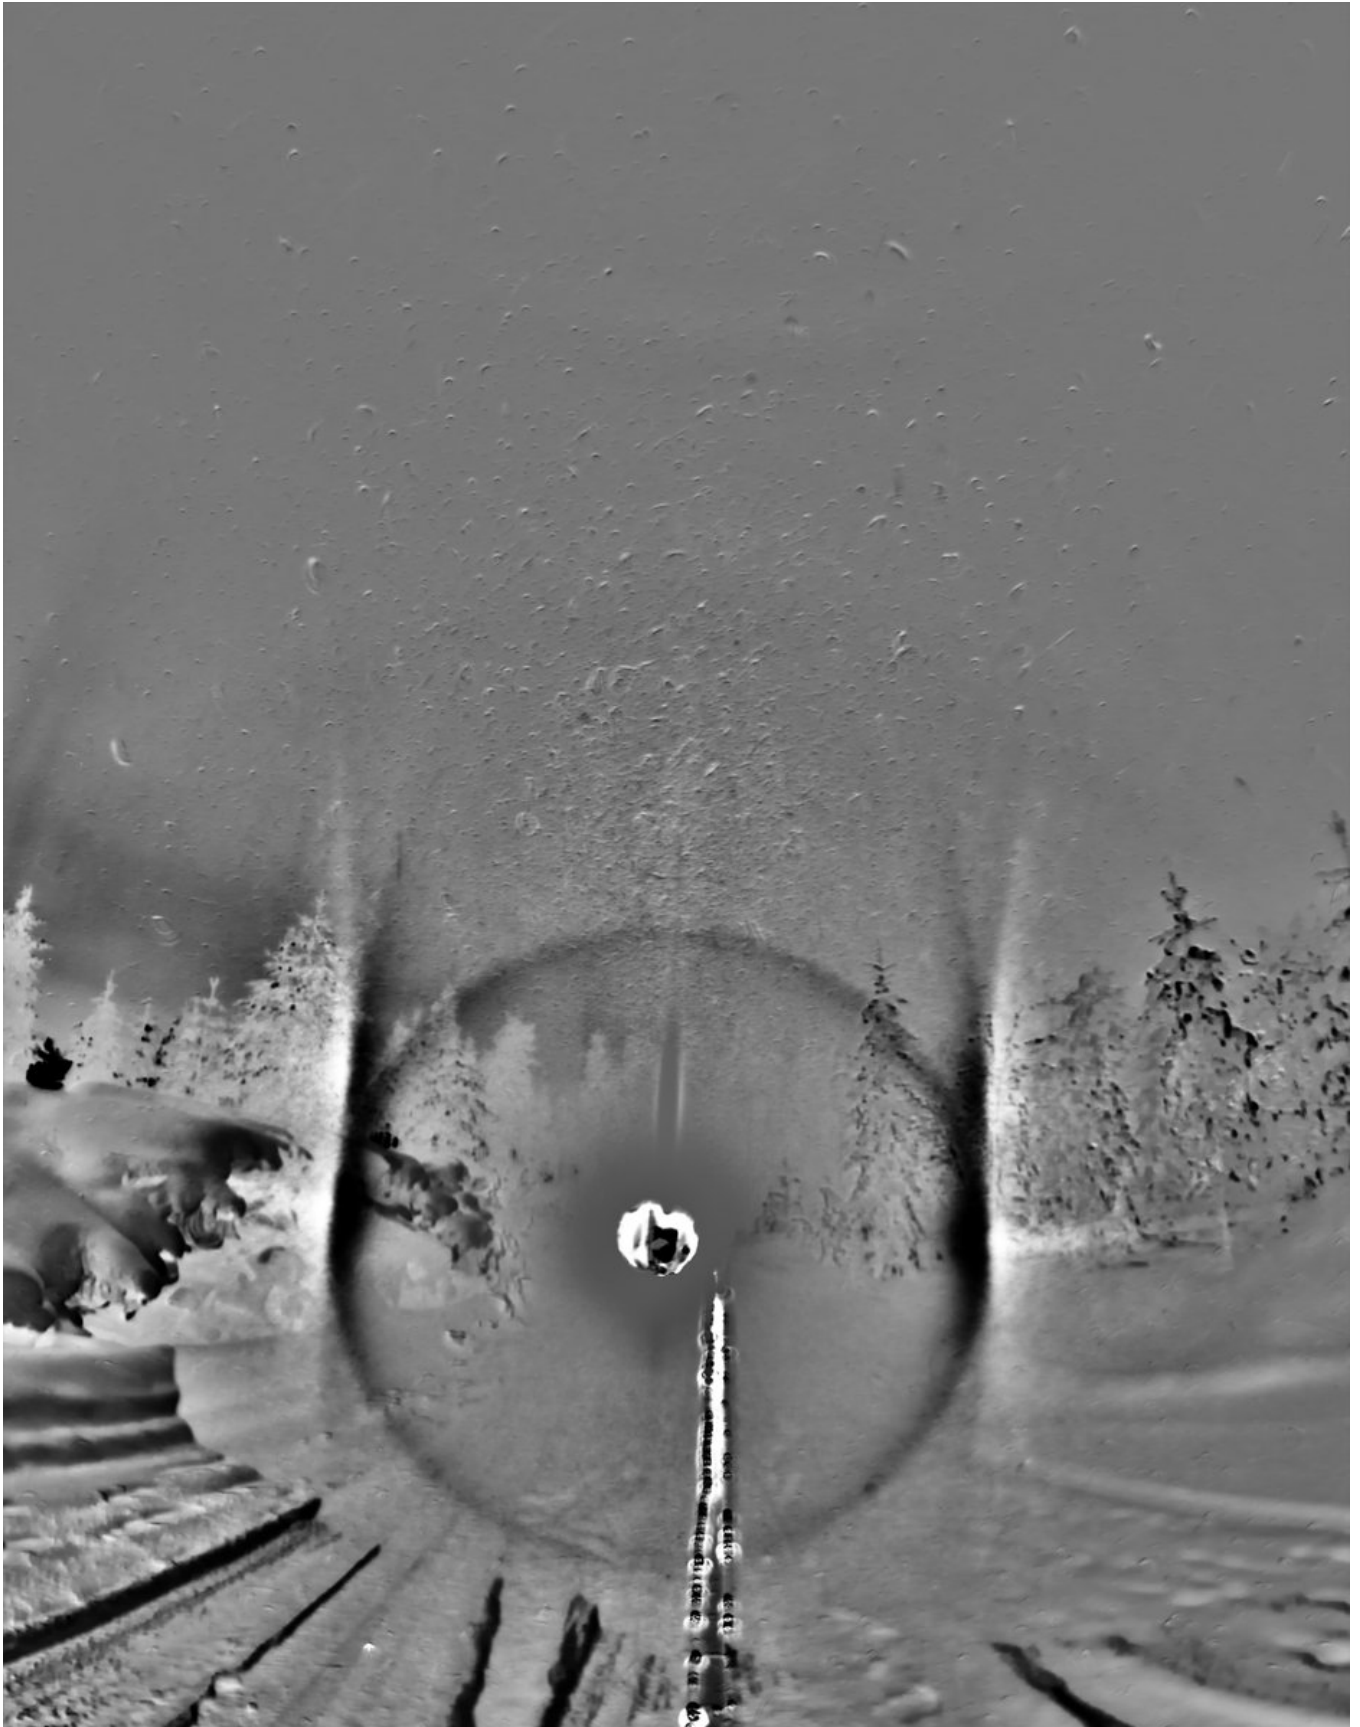

At the apartment, around 3 am I noticed an elevated, transparent fog layer had formed (a very common feature this winter). At sunrise it was largely cloudy, but started clearing soon and after 10 am I left for a round. Nothing to see – the gun had again fallen silent.

I believe the gunning will continue well into March, but looks like the coming night will be the last night for some days because it is getting windy and warming up. For the longest time (that's how I feel at least) we are going to have above freezing temps.

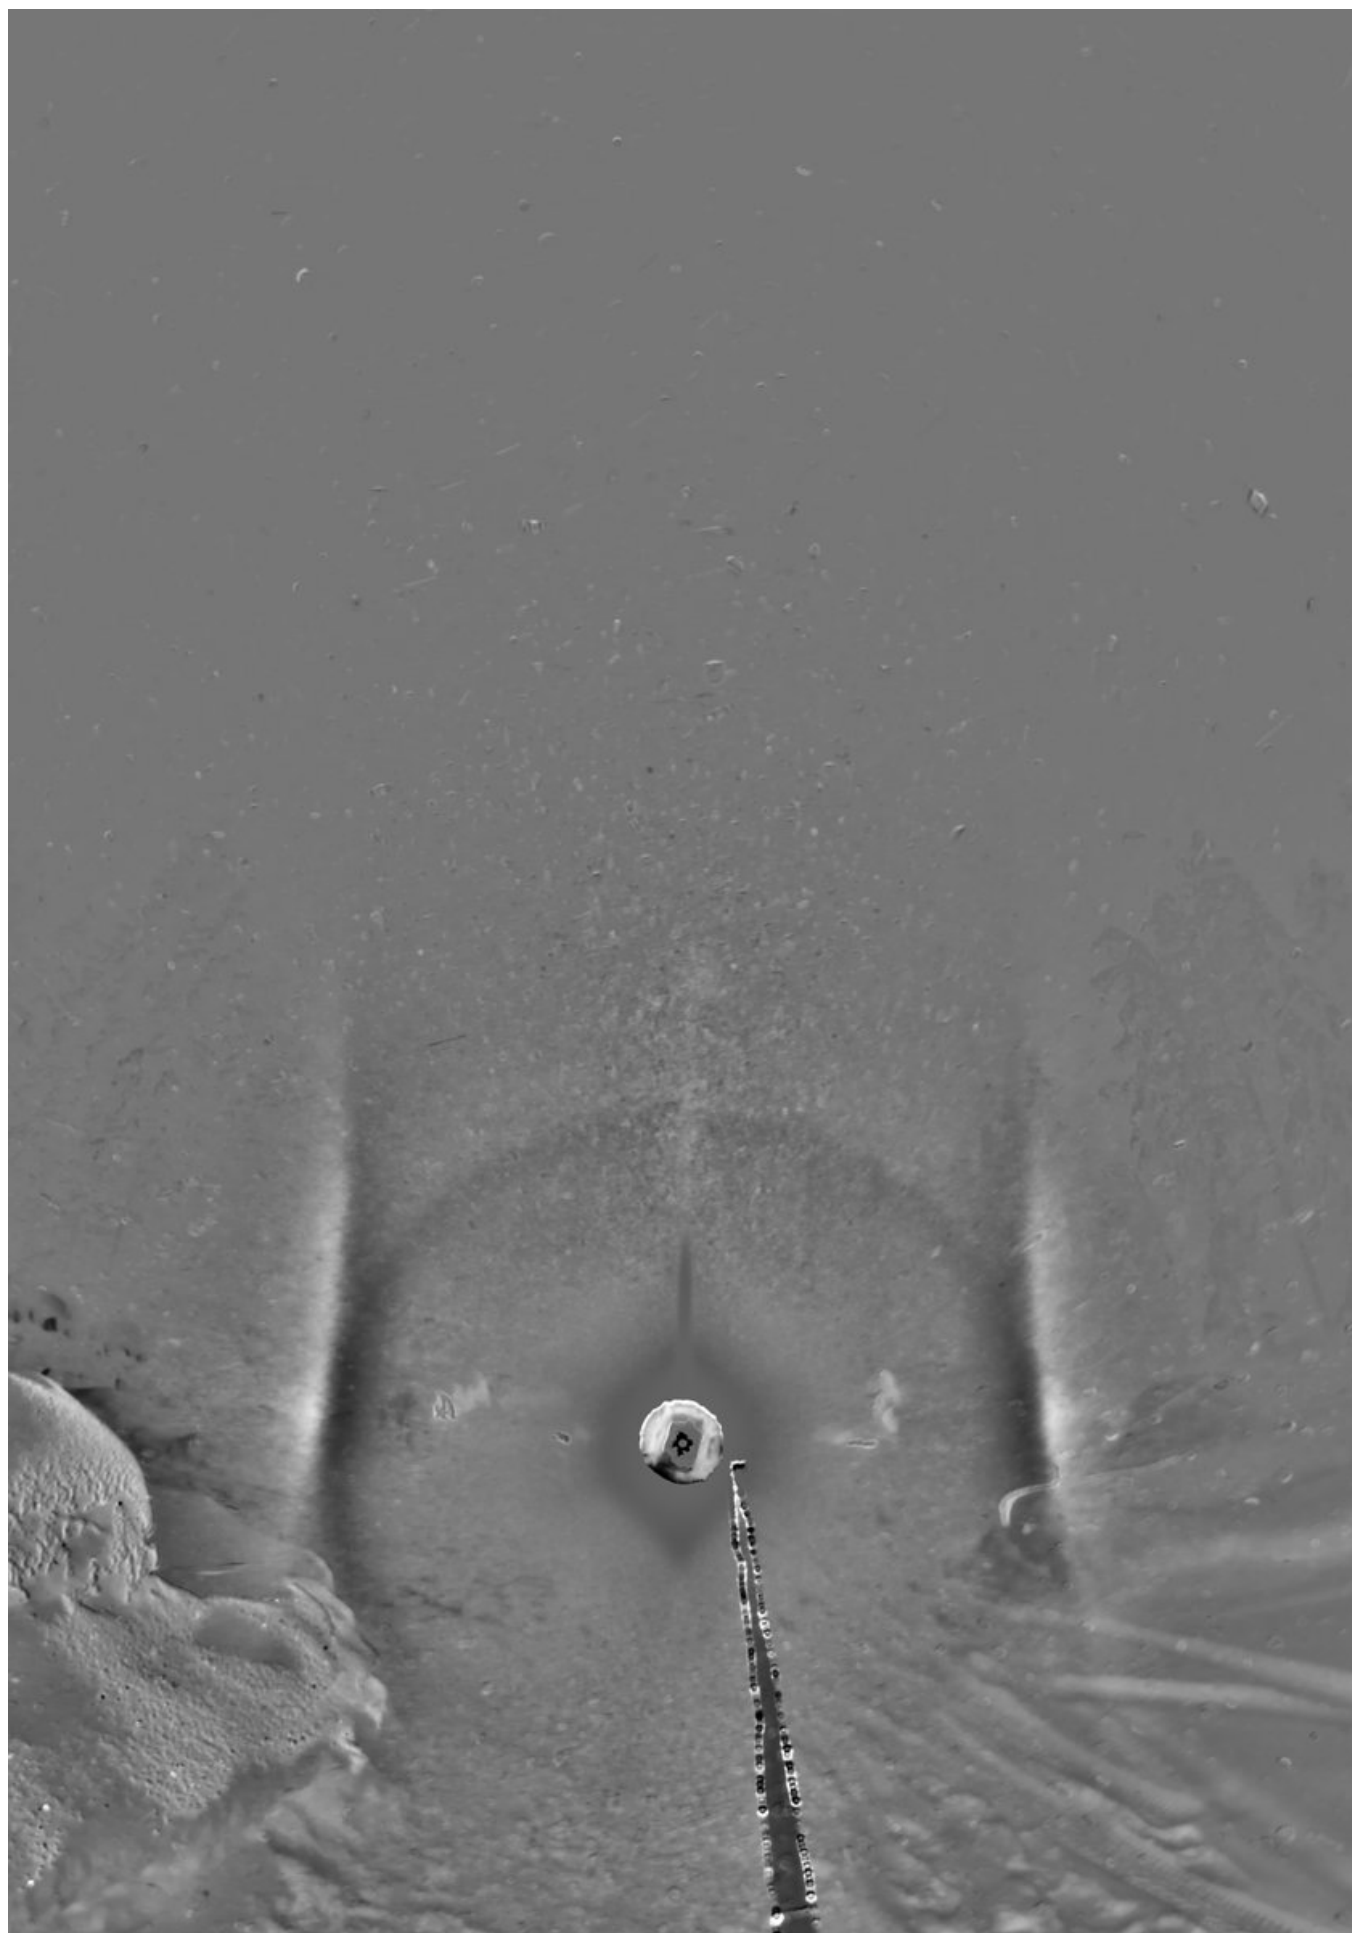

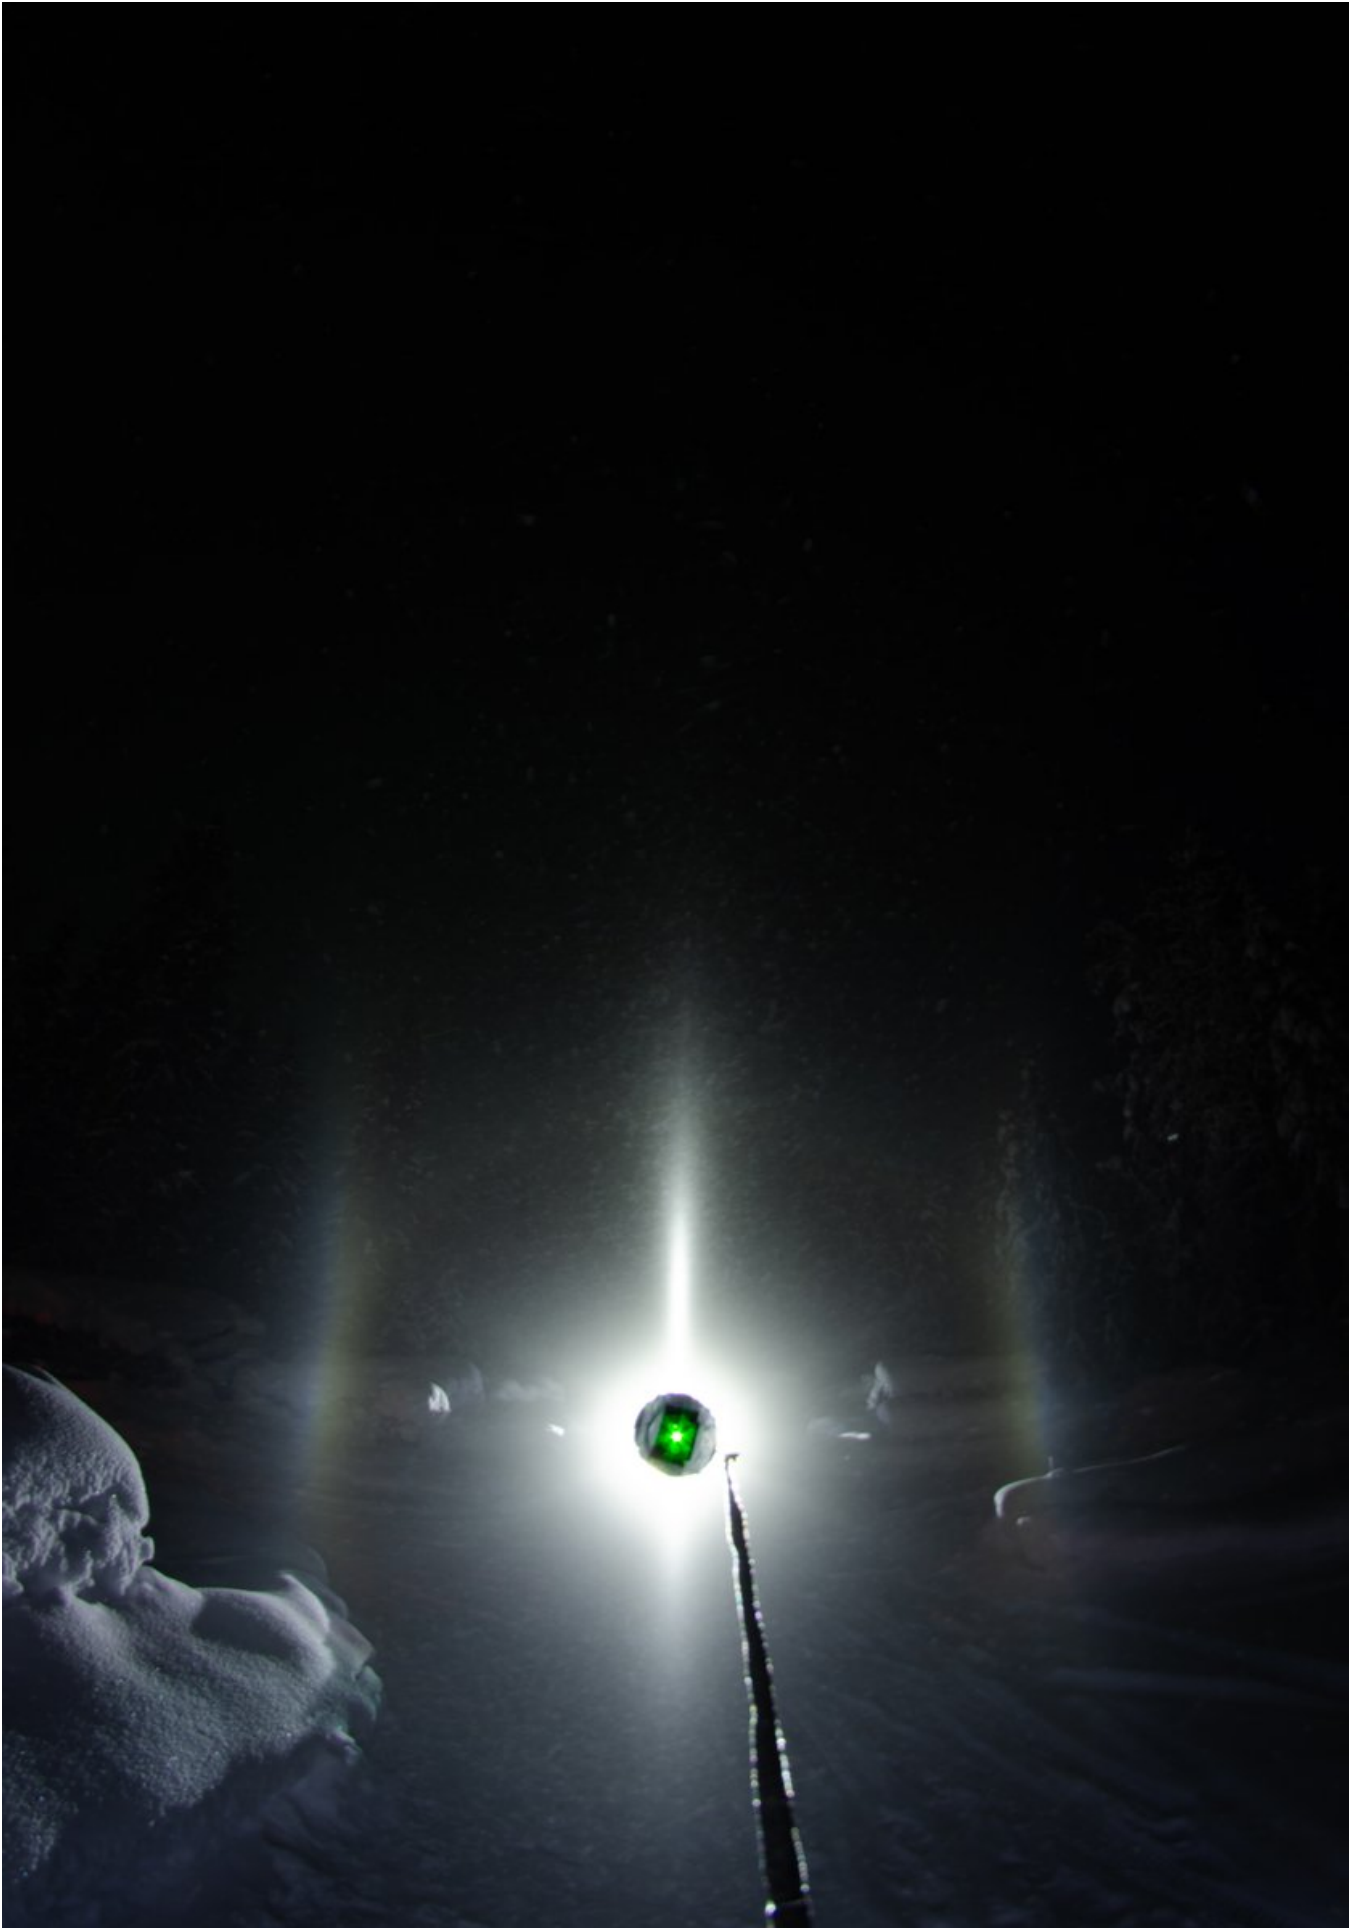

2/8 - 2026-02-25 11:40 UTC

23/24 Feb 2026, Rovaniemi. This is when the ice fog took on in earnest. Helic arc but nothing indicative of Parry – or anything at all on top of 22° halo for that matter. Helic arc was also visible to the eye.

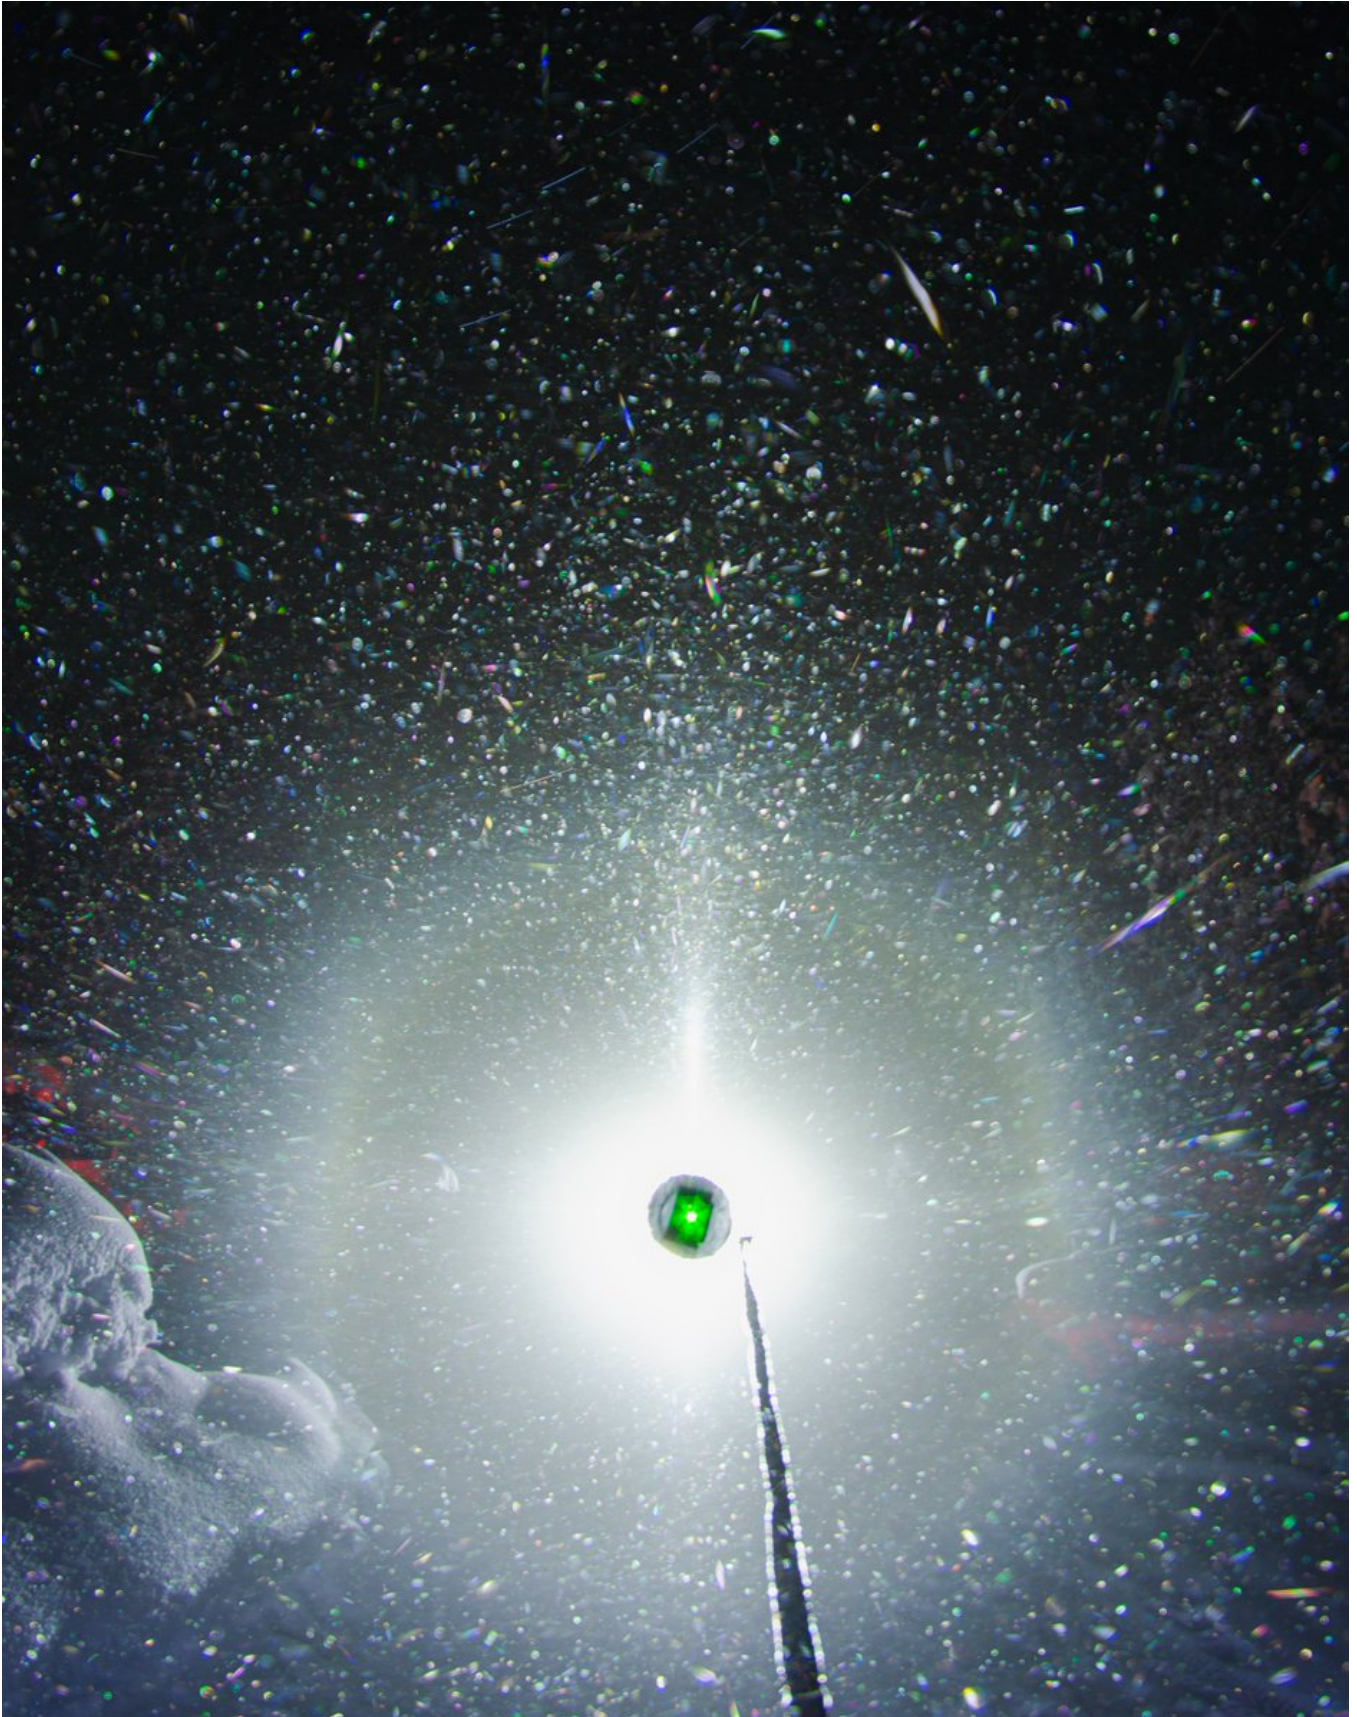

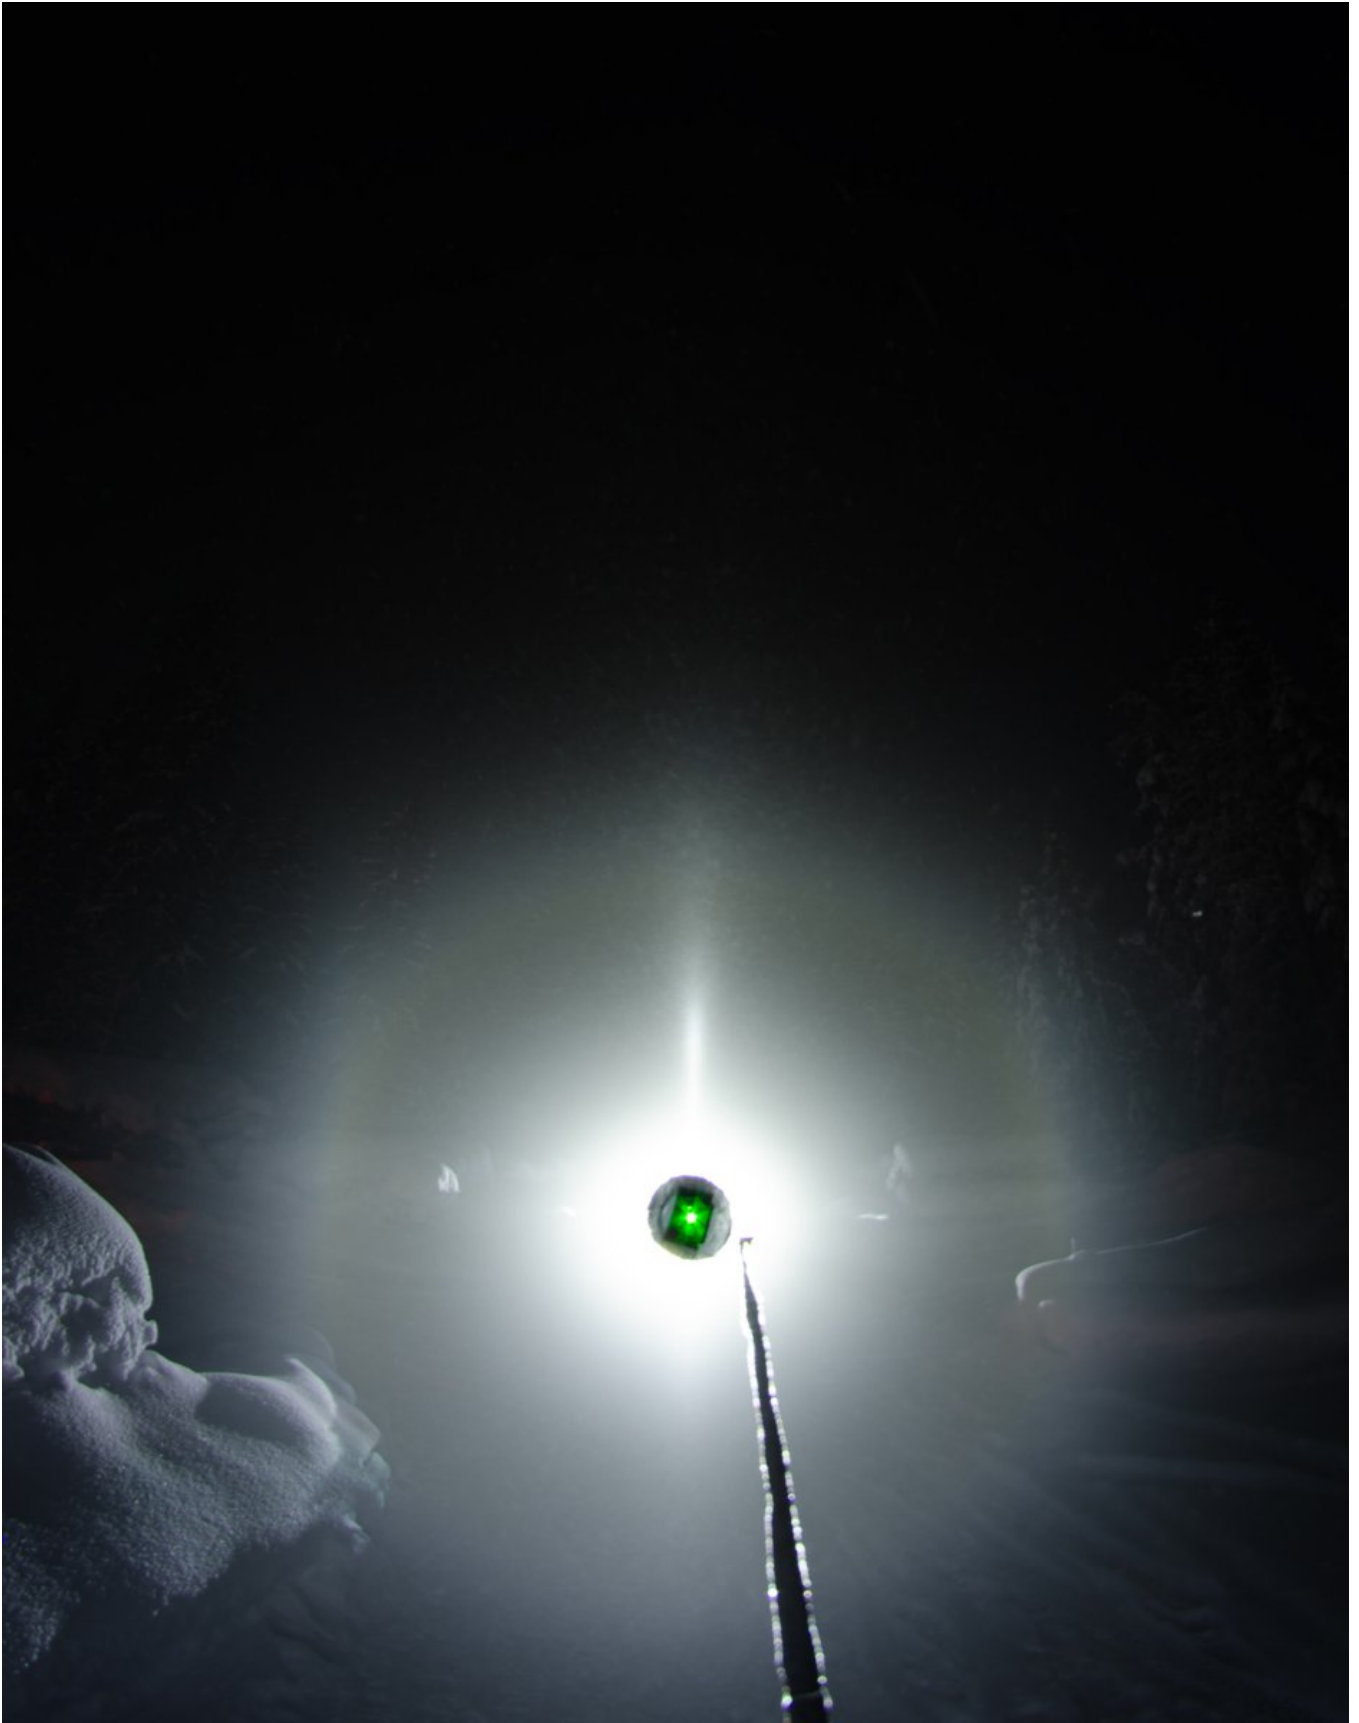

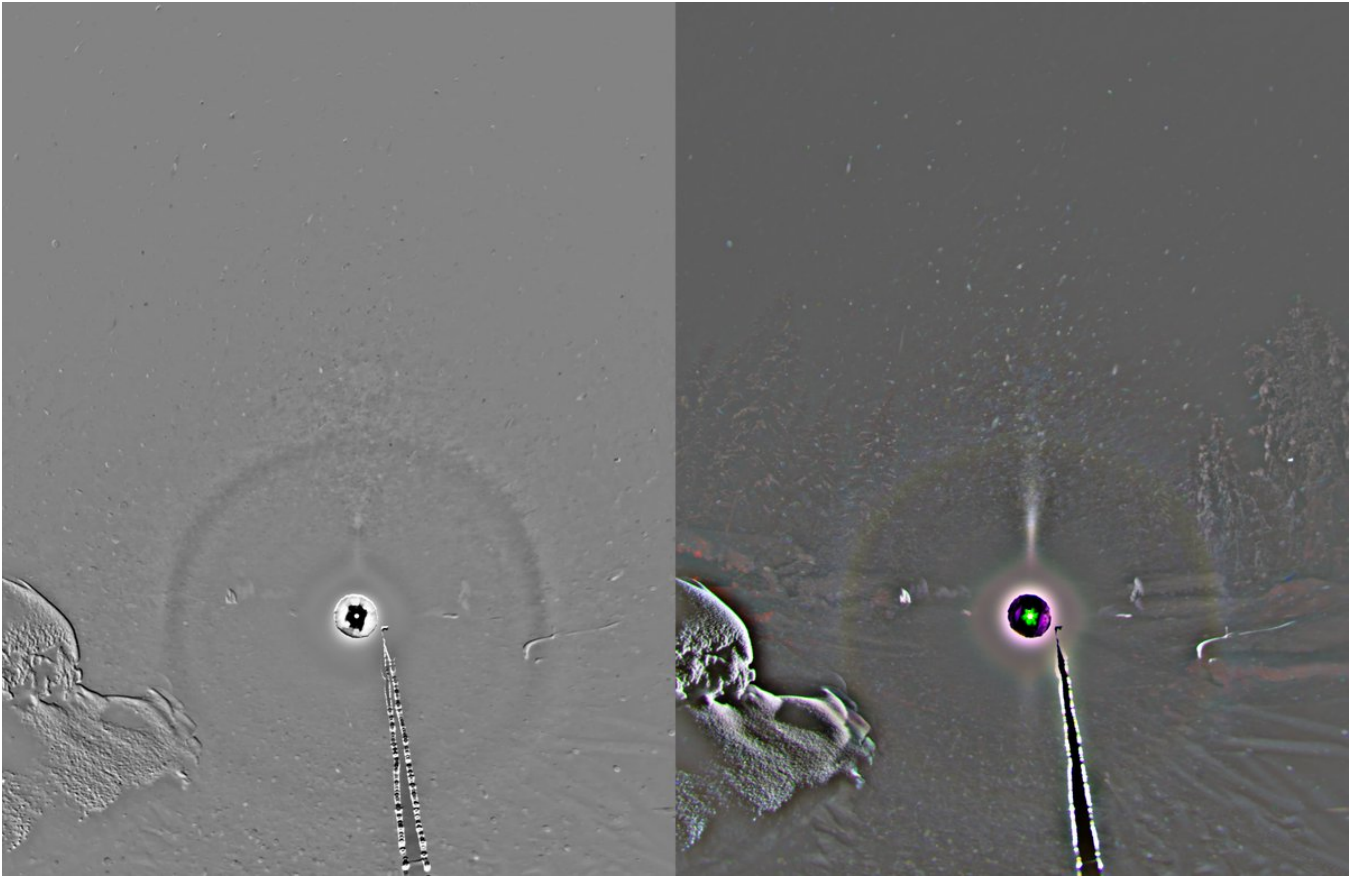

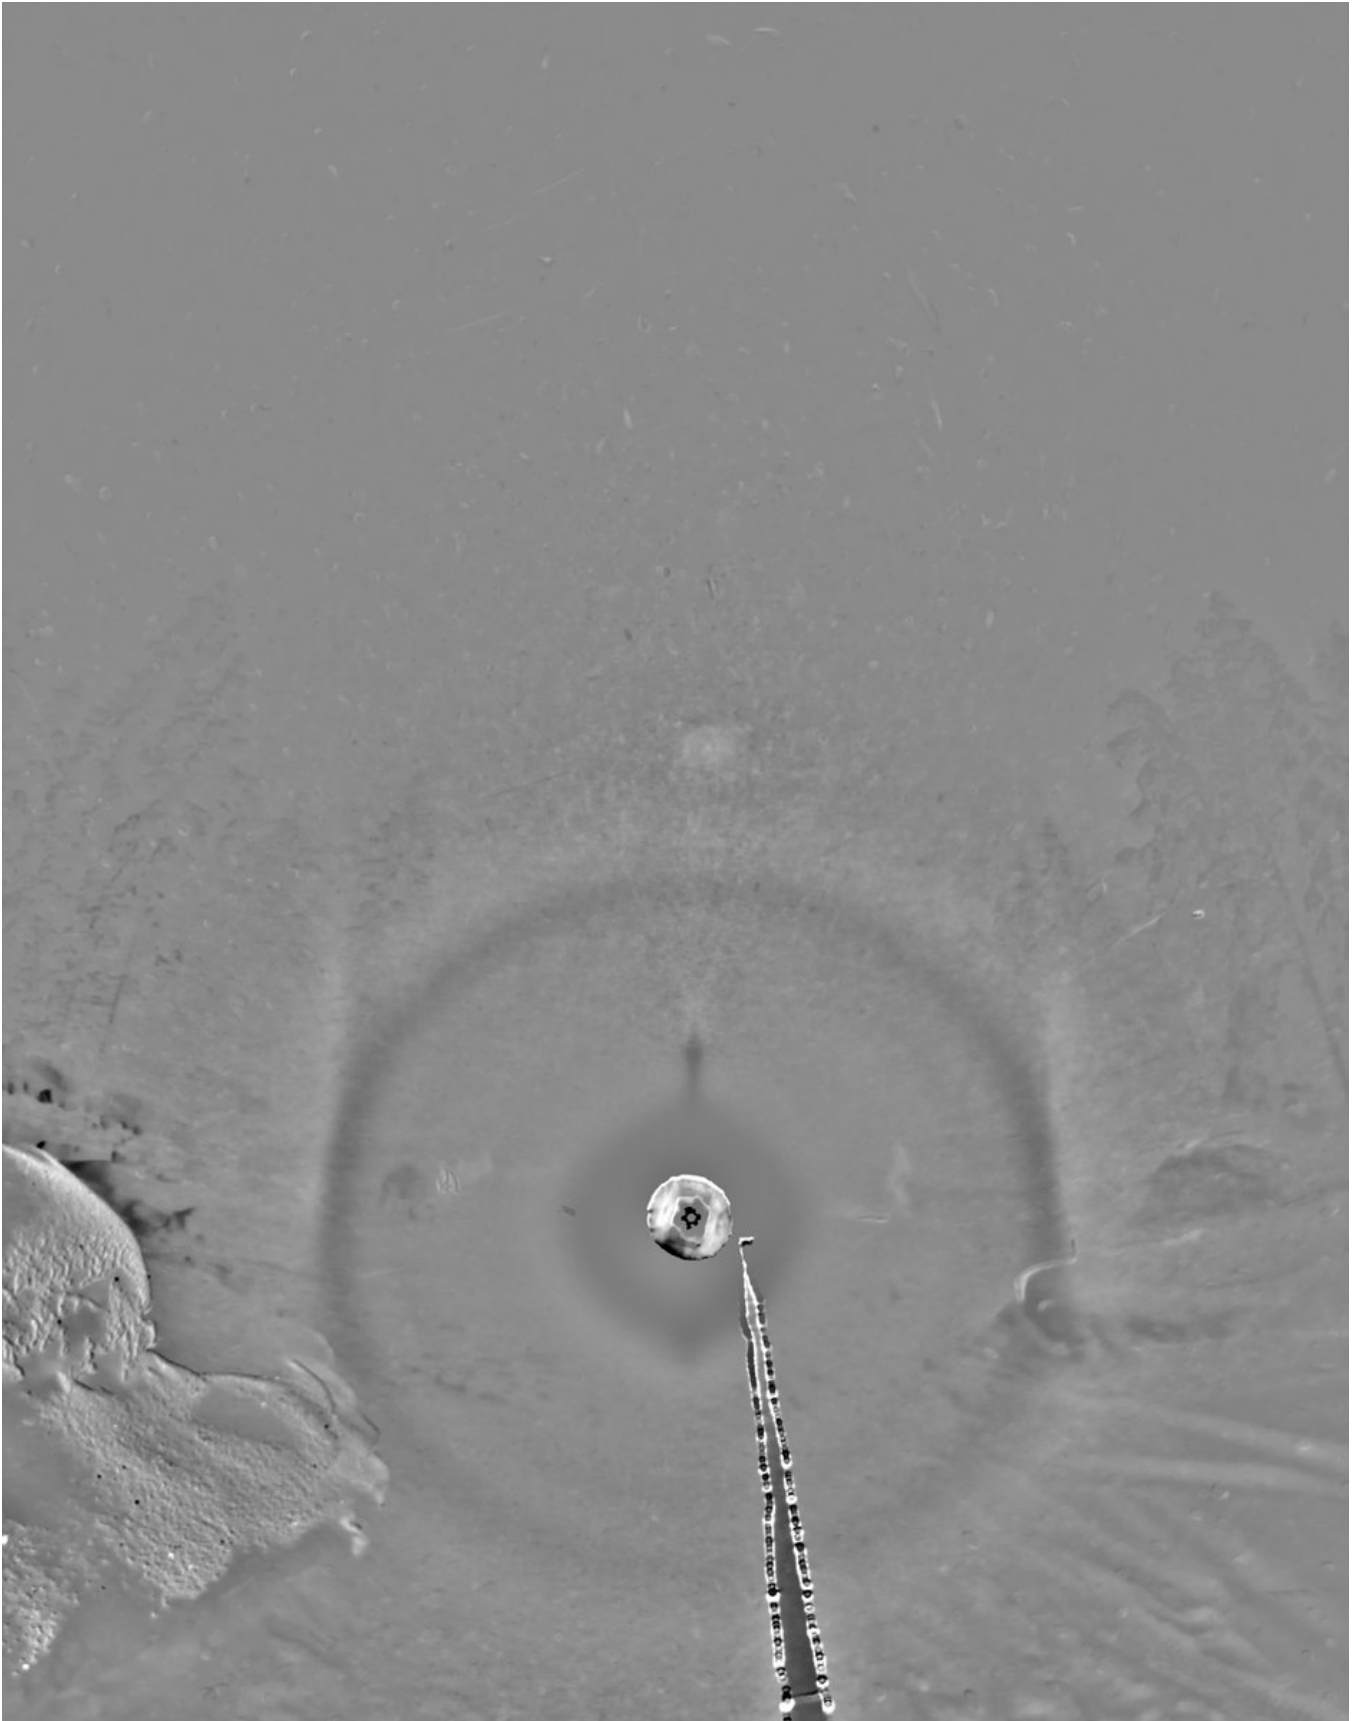

3/8 - 2026-02-25 12:13 UTC

23/24 Feb 2026, Rovaniemi. From the start of crystal sampling, 45 x 30s, fourth image is a partial 13f stack of a bit weaker phase which allowed Moilanen arc to show better. Lamp is some 4-5 degree below horizon. Weak 18° halo seems to be present.

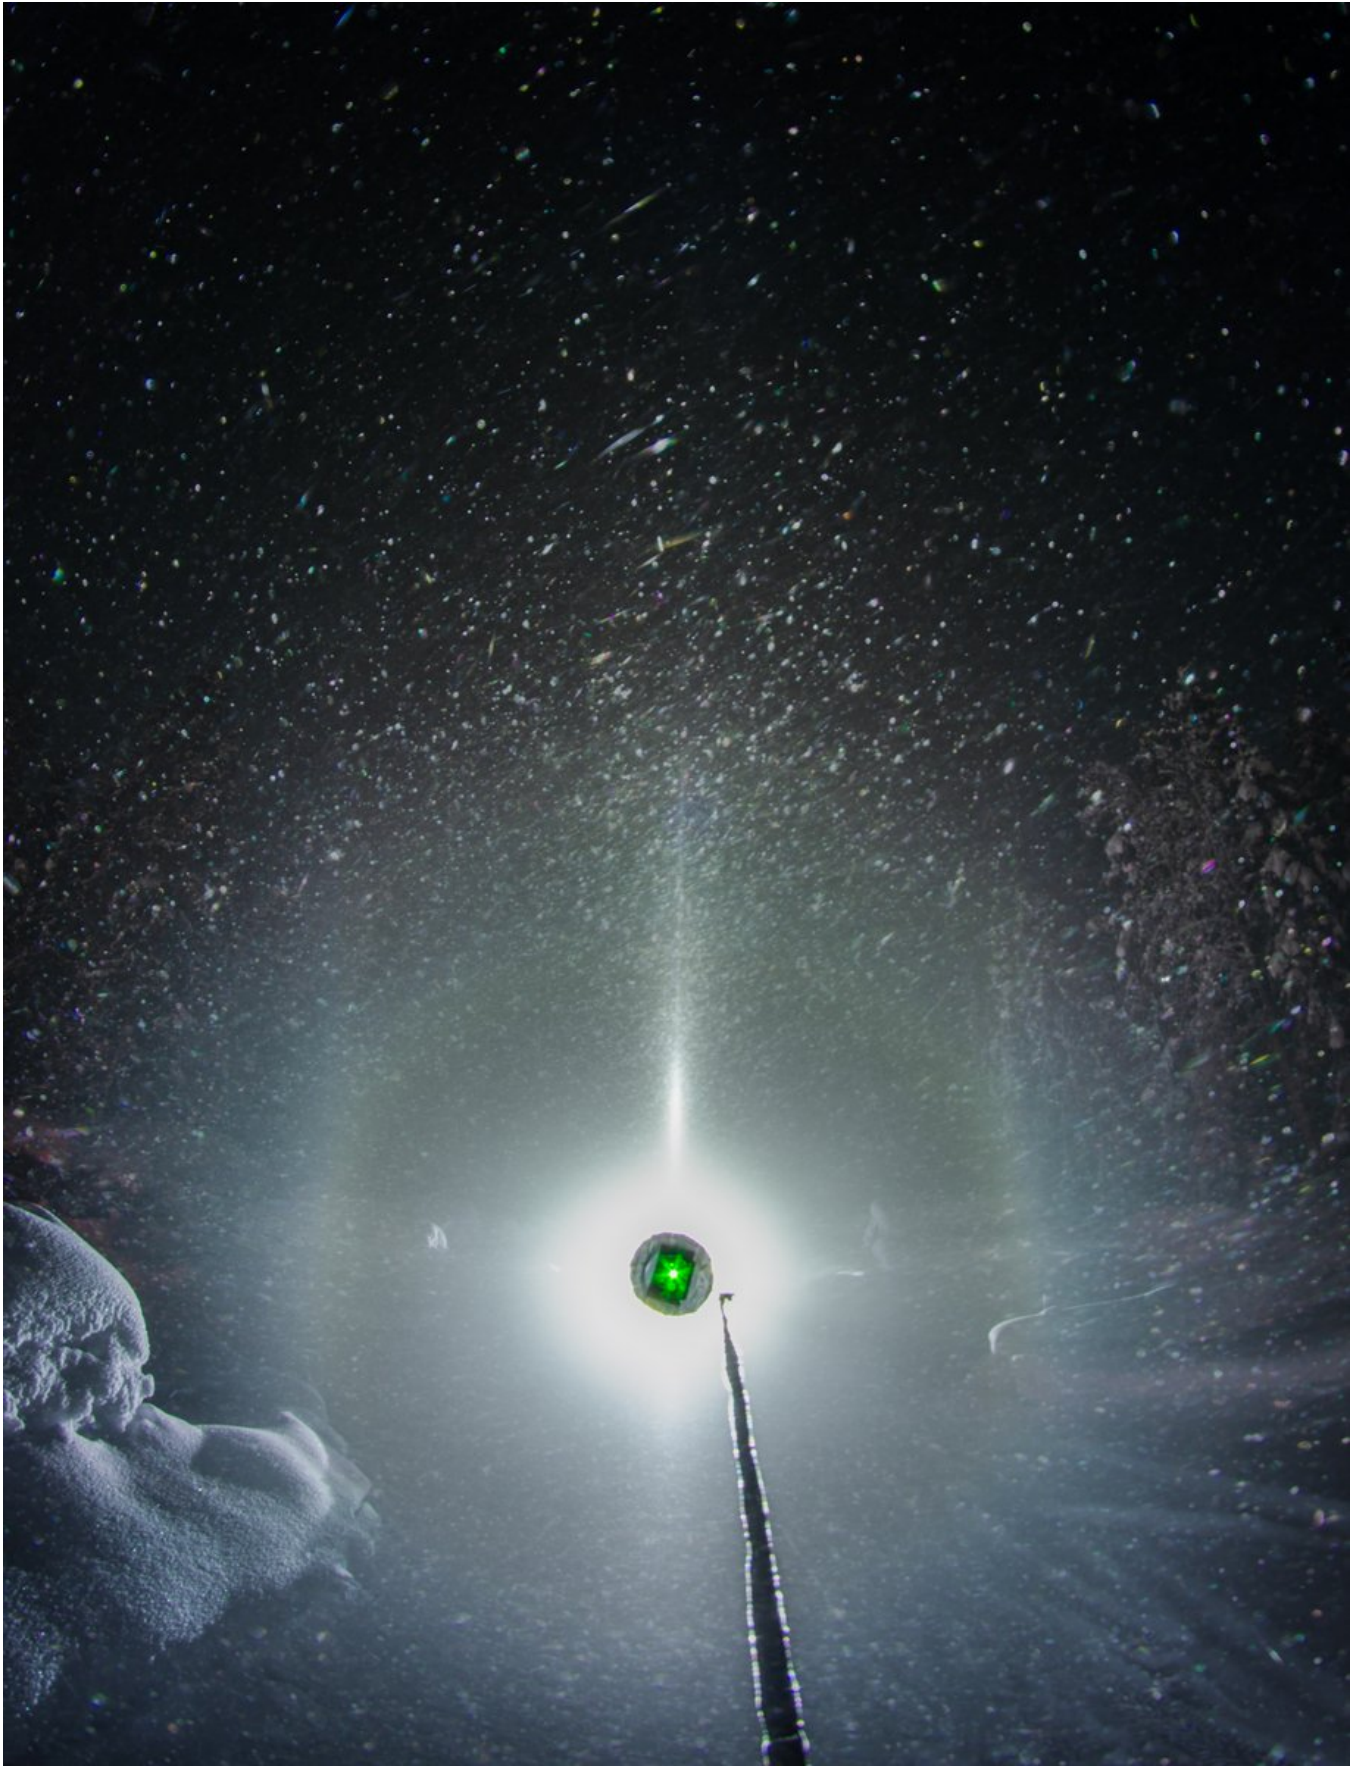

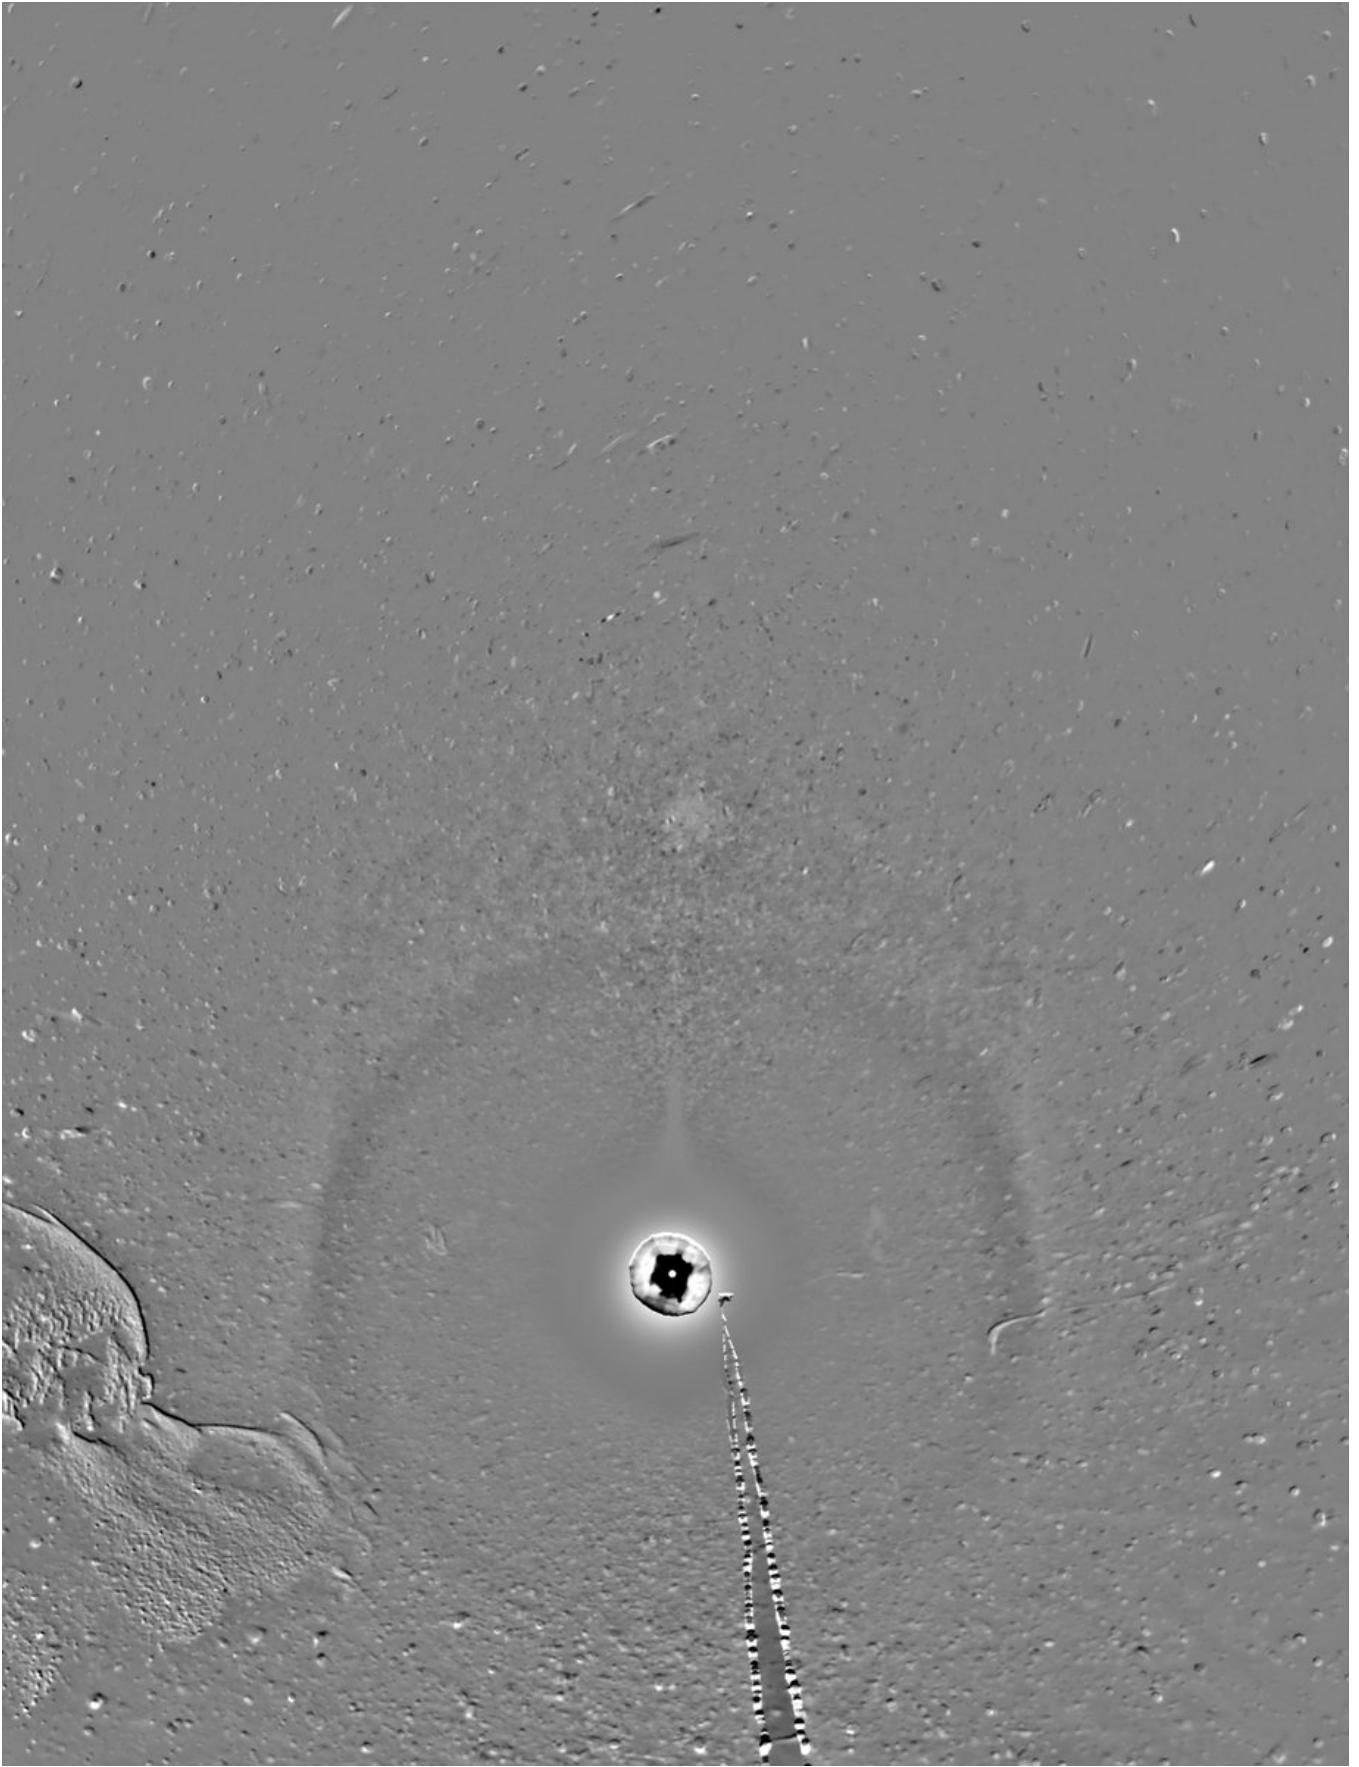

4/8 - 2026-02-25 12:44 UTC

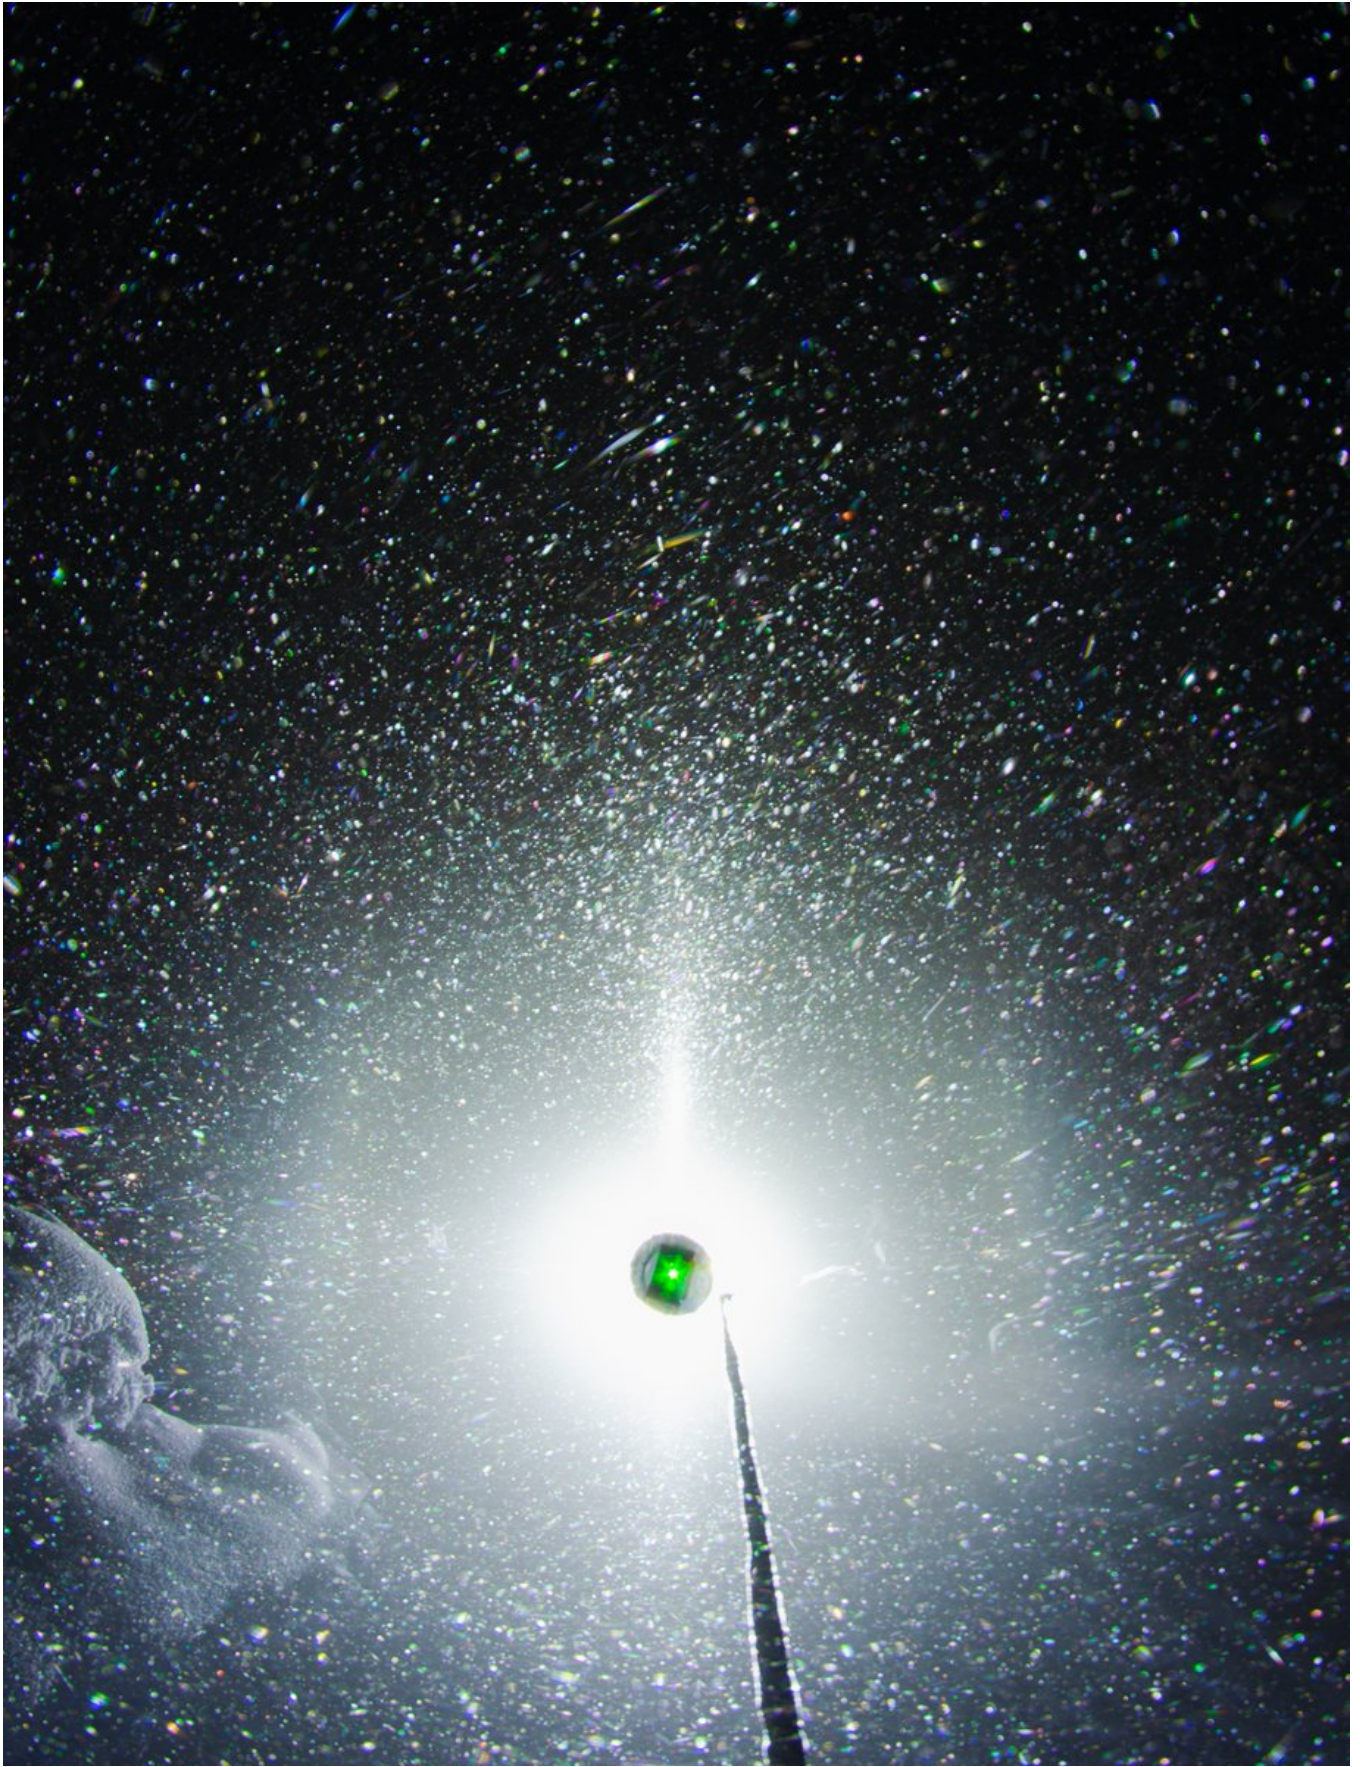

23/24 Feb 2026, Rovaniemi. Towards the end of crystal photography I noticed big thin plates started landing on the dish more often. Checked the beam, indeed, the display had changed a bit, pillar had become stronger and white random glitter from large crystals more prominent. So here is a separate 8f

stack of the changed display after the above 45f stack (images are cropped). That's the last photos I took.

The blue lens reflection above the 22° halo got me to look back at the anomalous arc in the display on the 17/18 Feb night: <https://t.co/UE6uR04AgY> It's different, doesn't strike me as lens reflection. The positioning of the light differs in these two displays, for one, that's landscape orientation in 17/18 Feb whilst this is portrait.

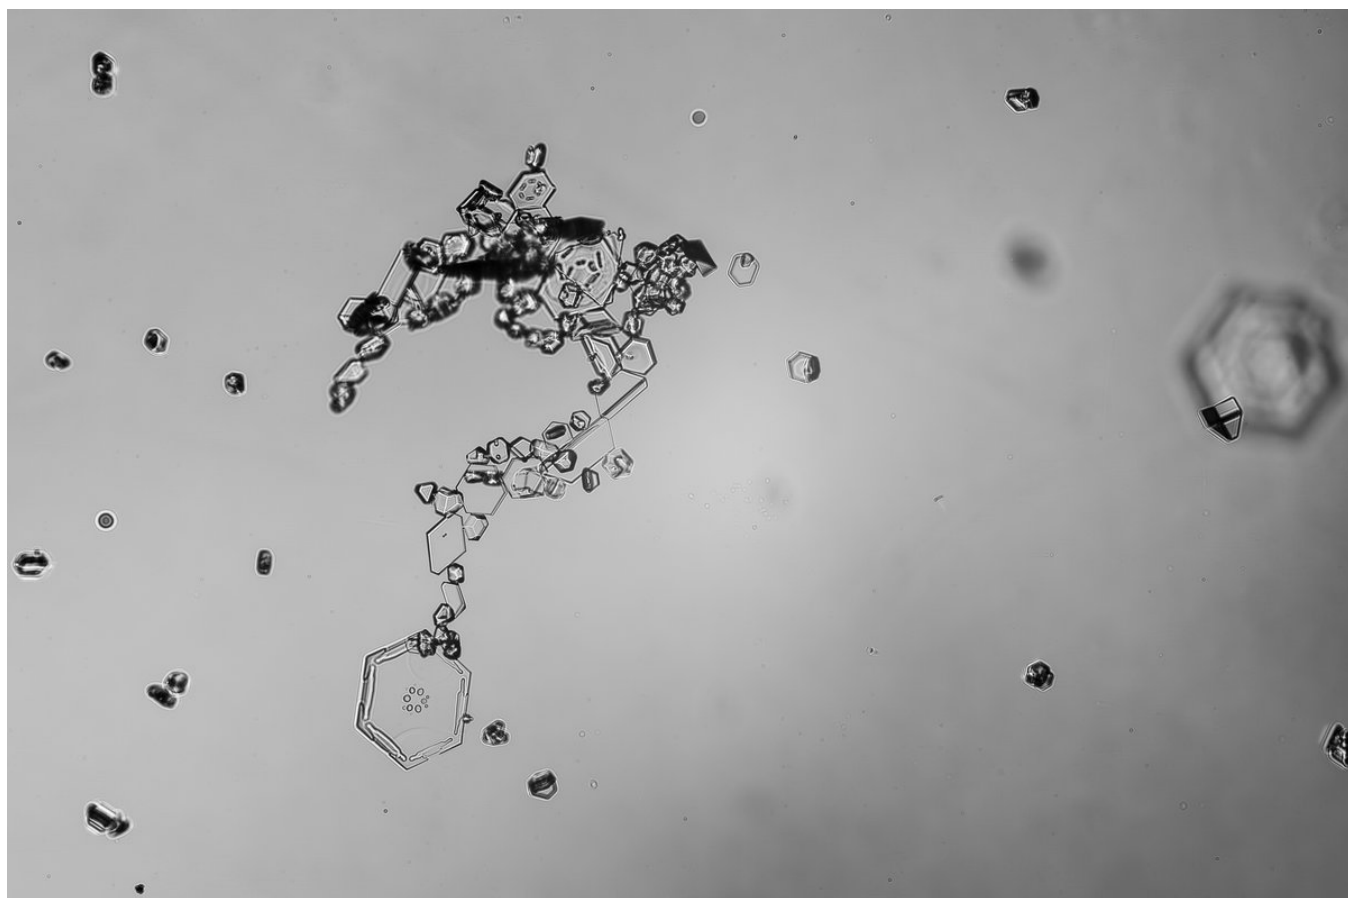

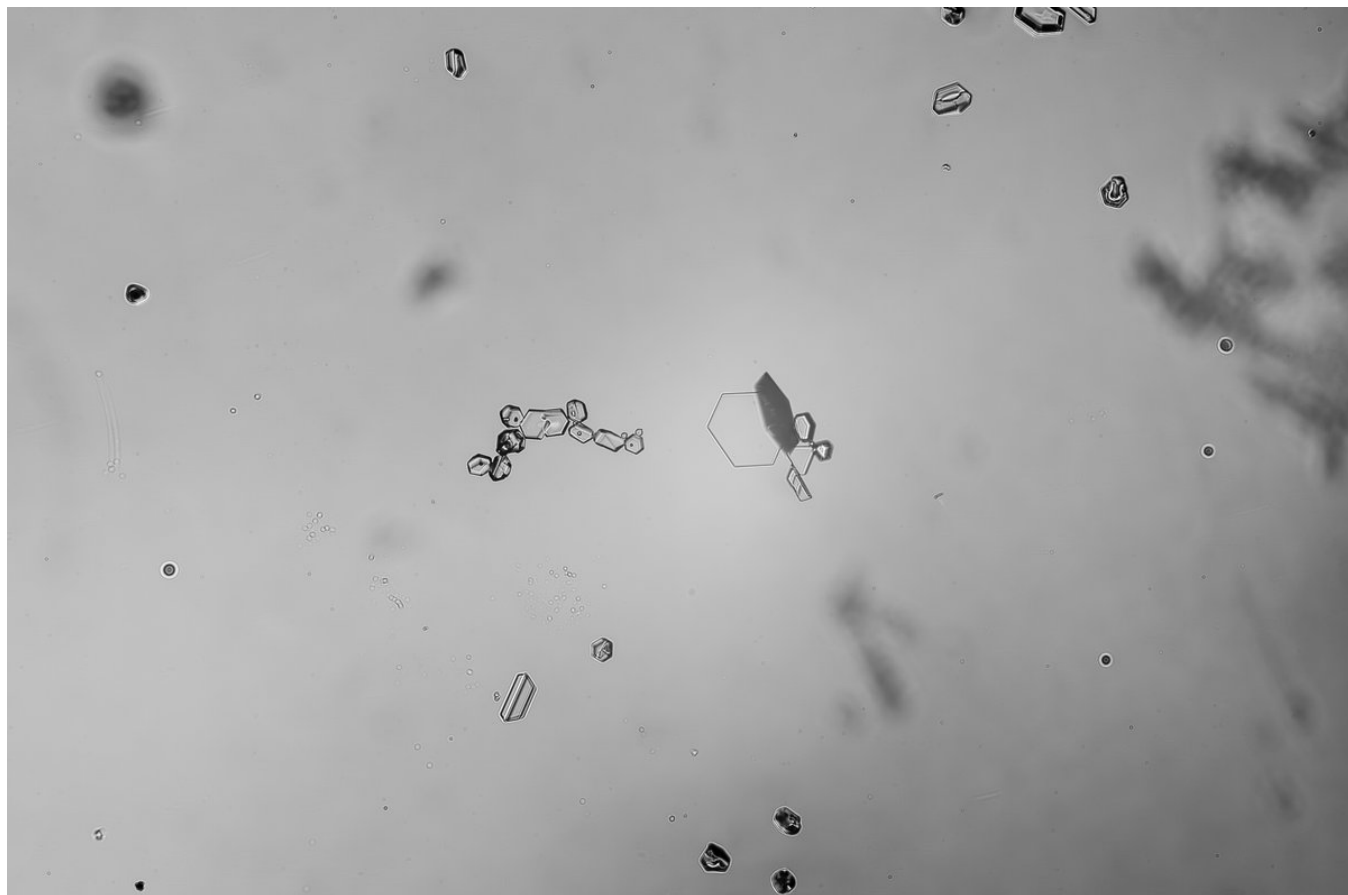

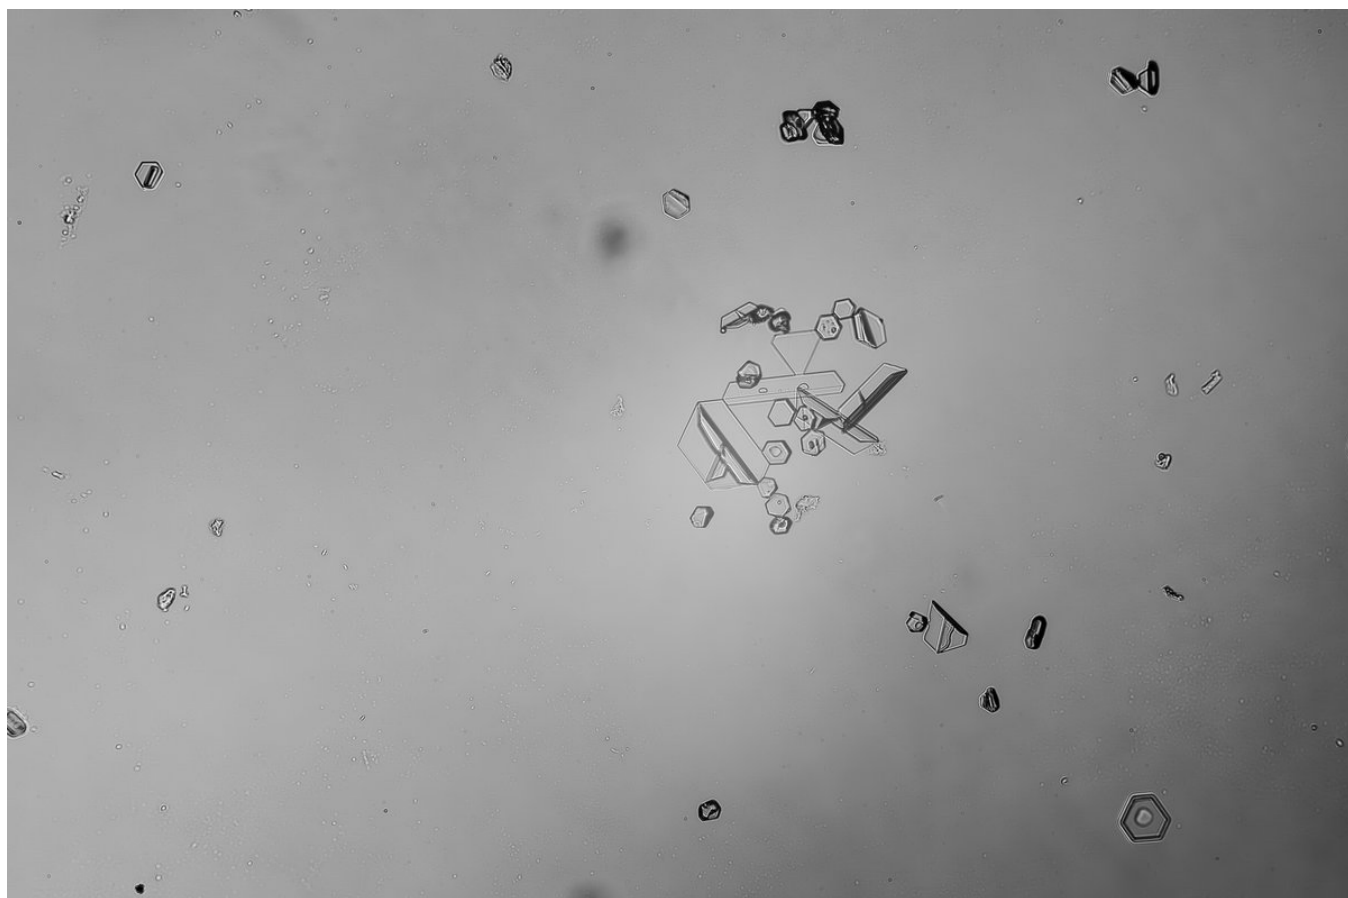

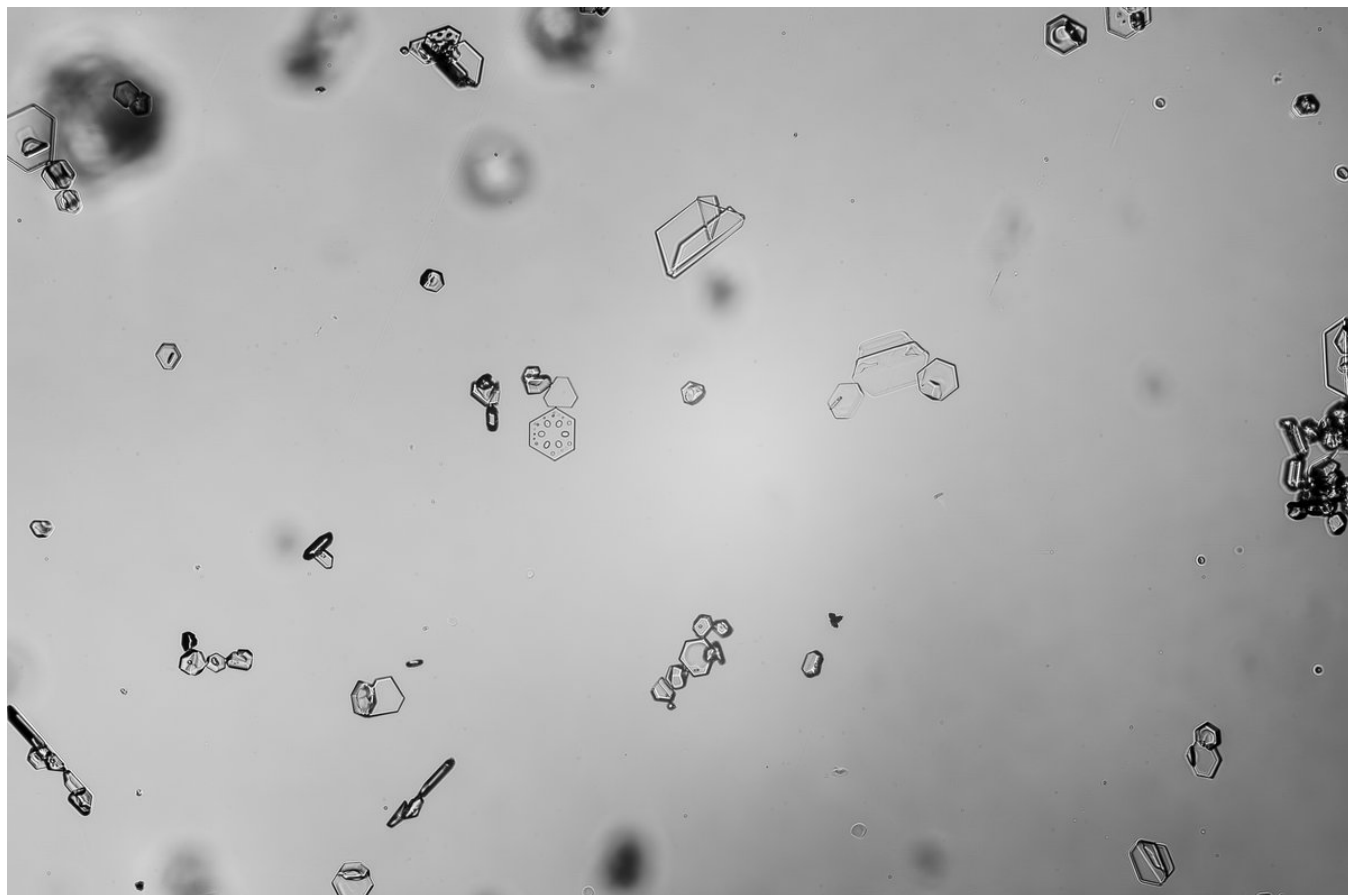

5/8 - 2026-02-25 13:09 UTC

23/24 Feb 2026, Rovaniemi. Crystals. It beats me how those elongated crossed plates are supposed to make Moilanen arc.

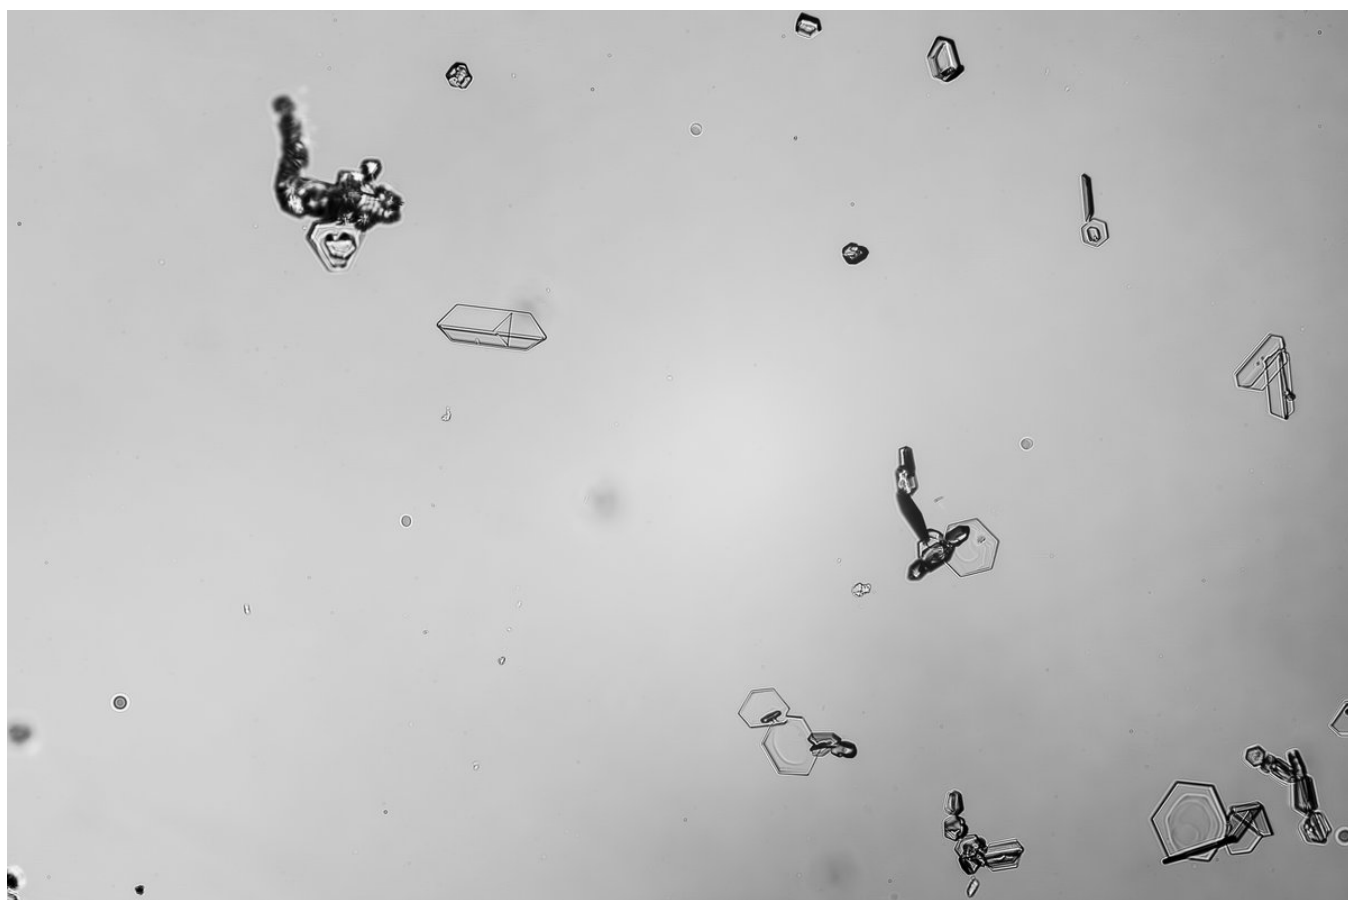

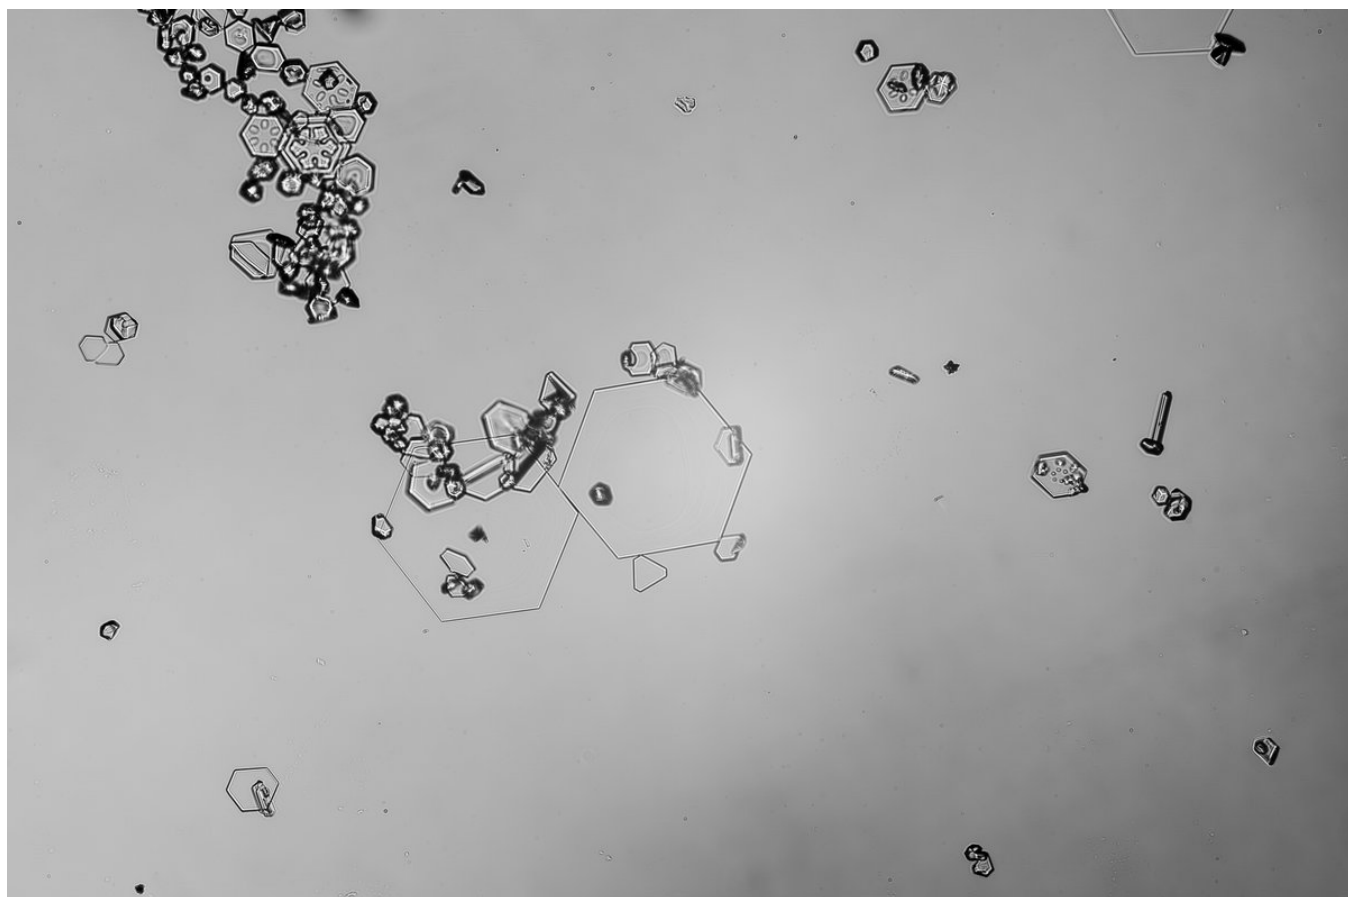

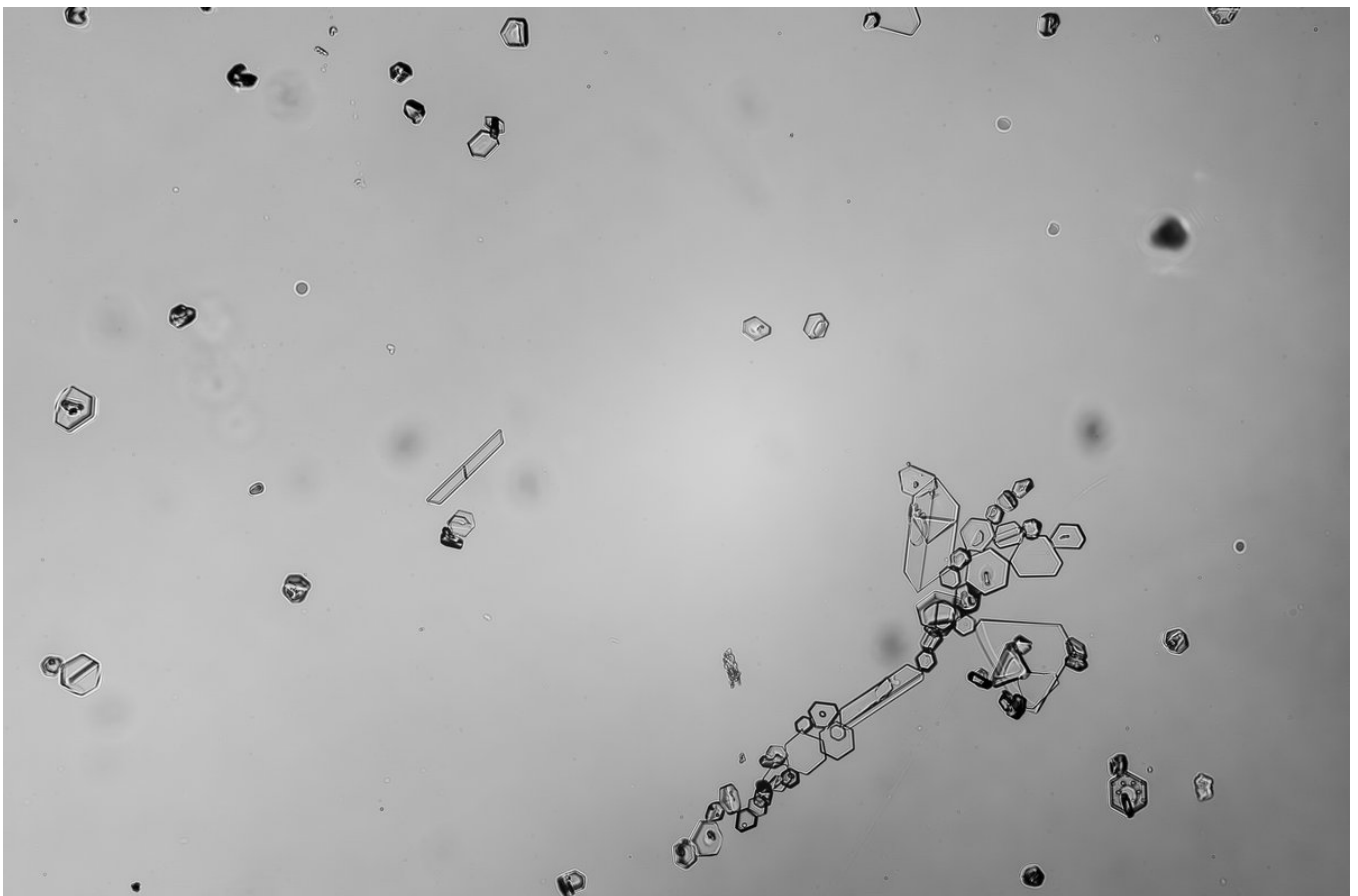

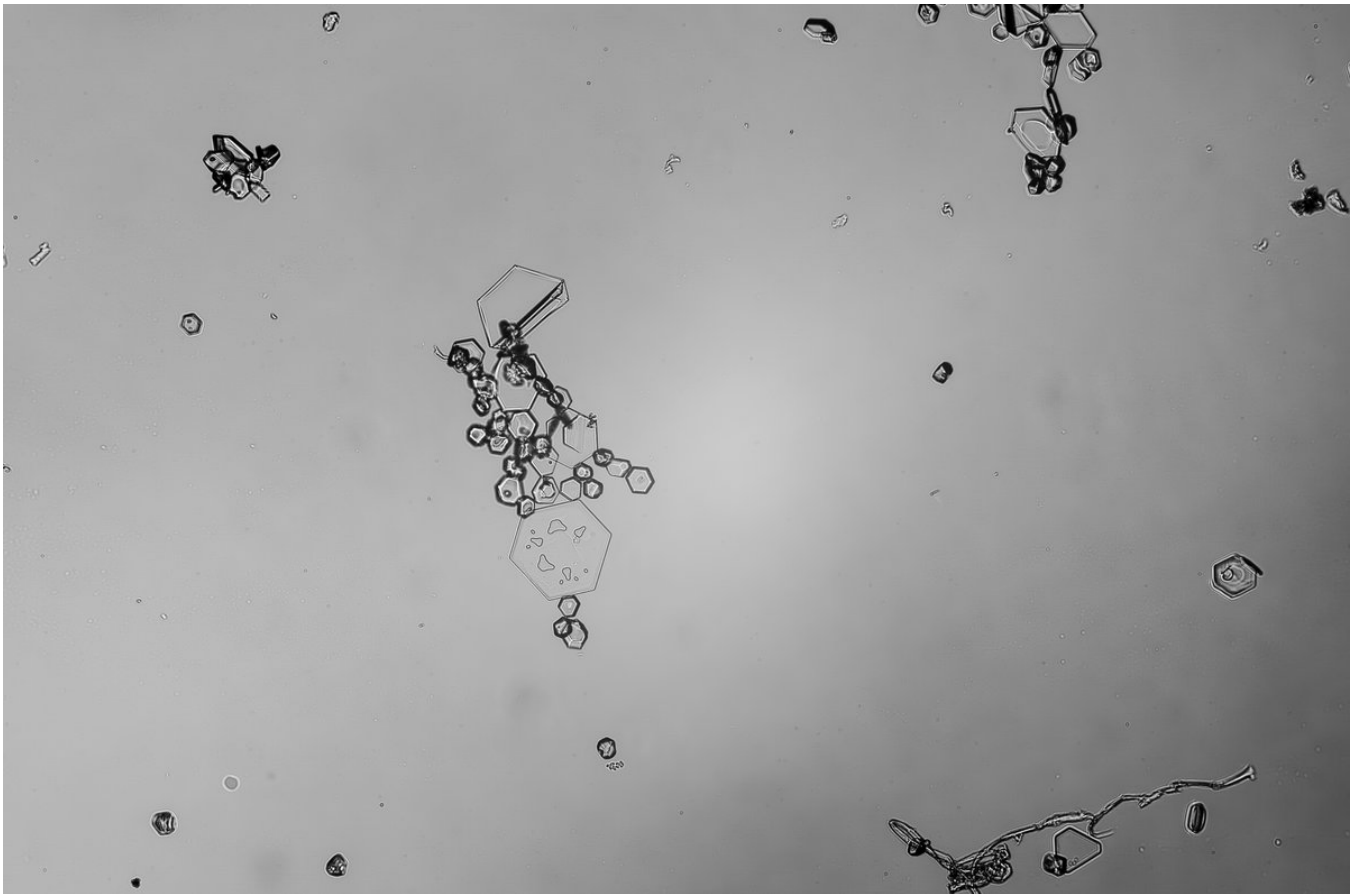

6/8 - 2026-02-25 13:14 UTC

23/24 Feb 2026, Rovaniemi. Many of the small crystals defy description, but in some I think of seeing

a pyramid shape.

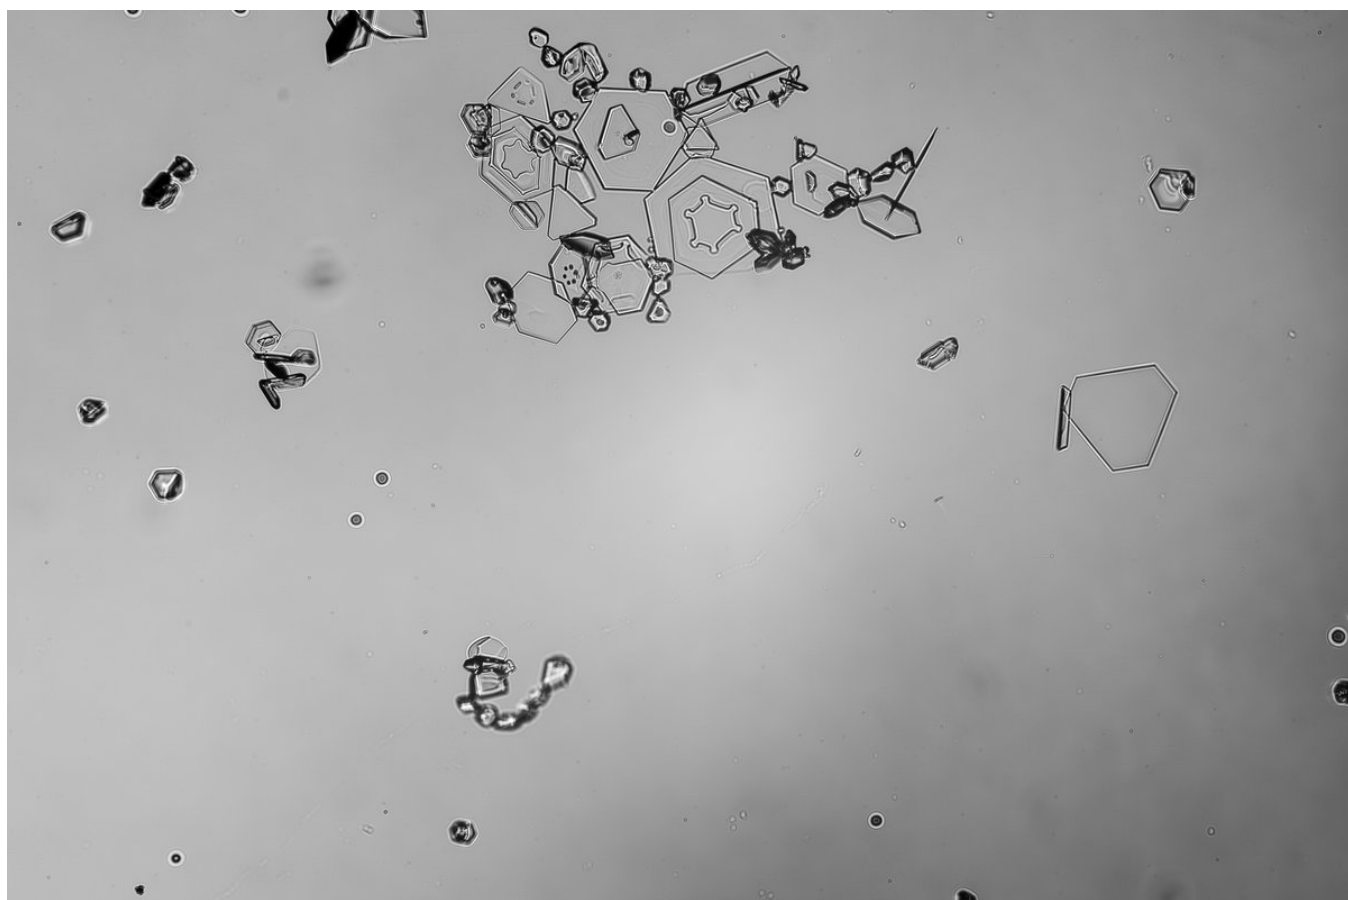

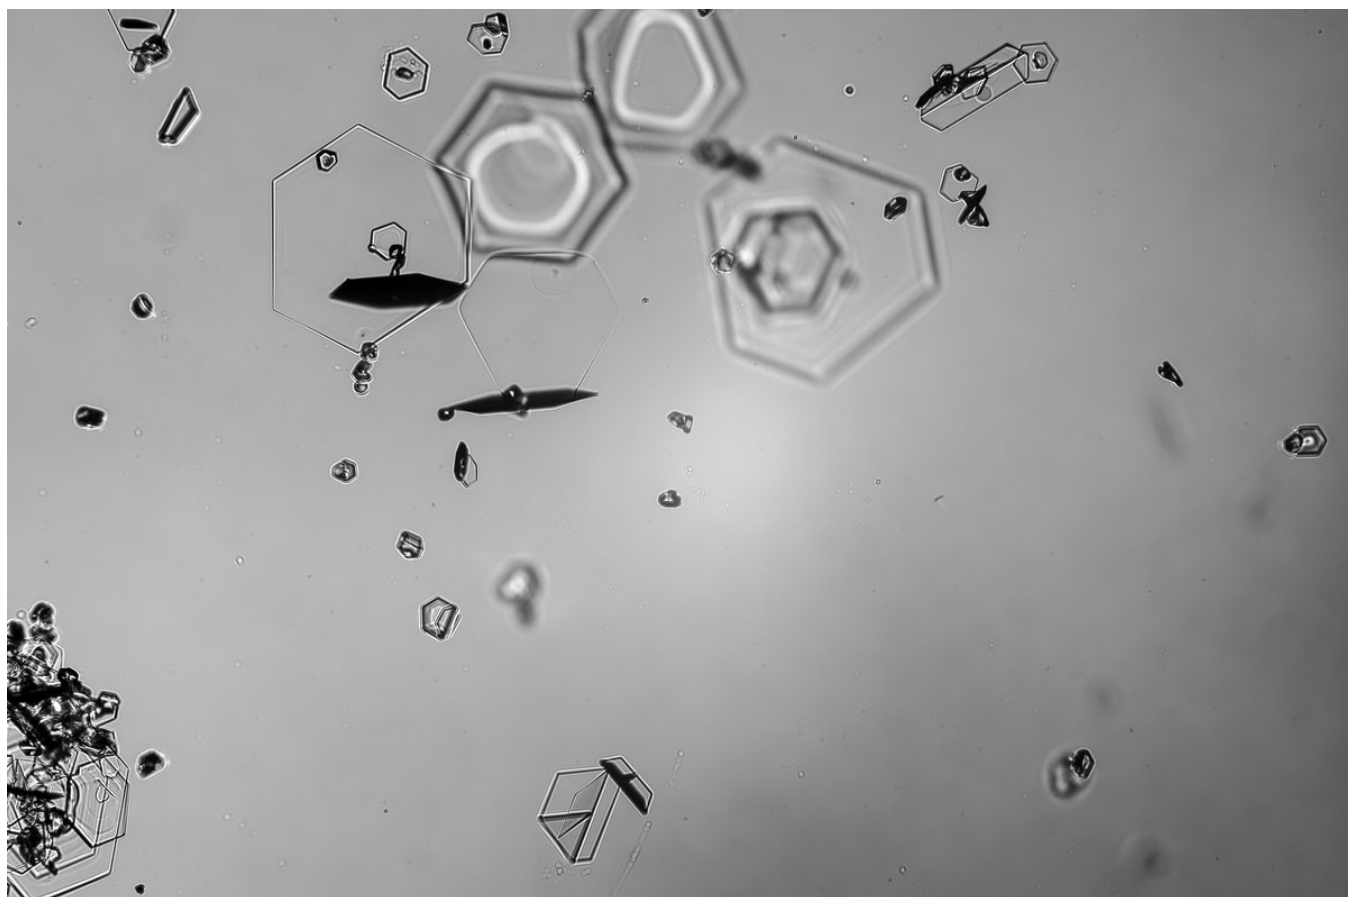

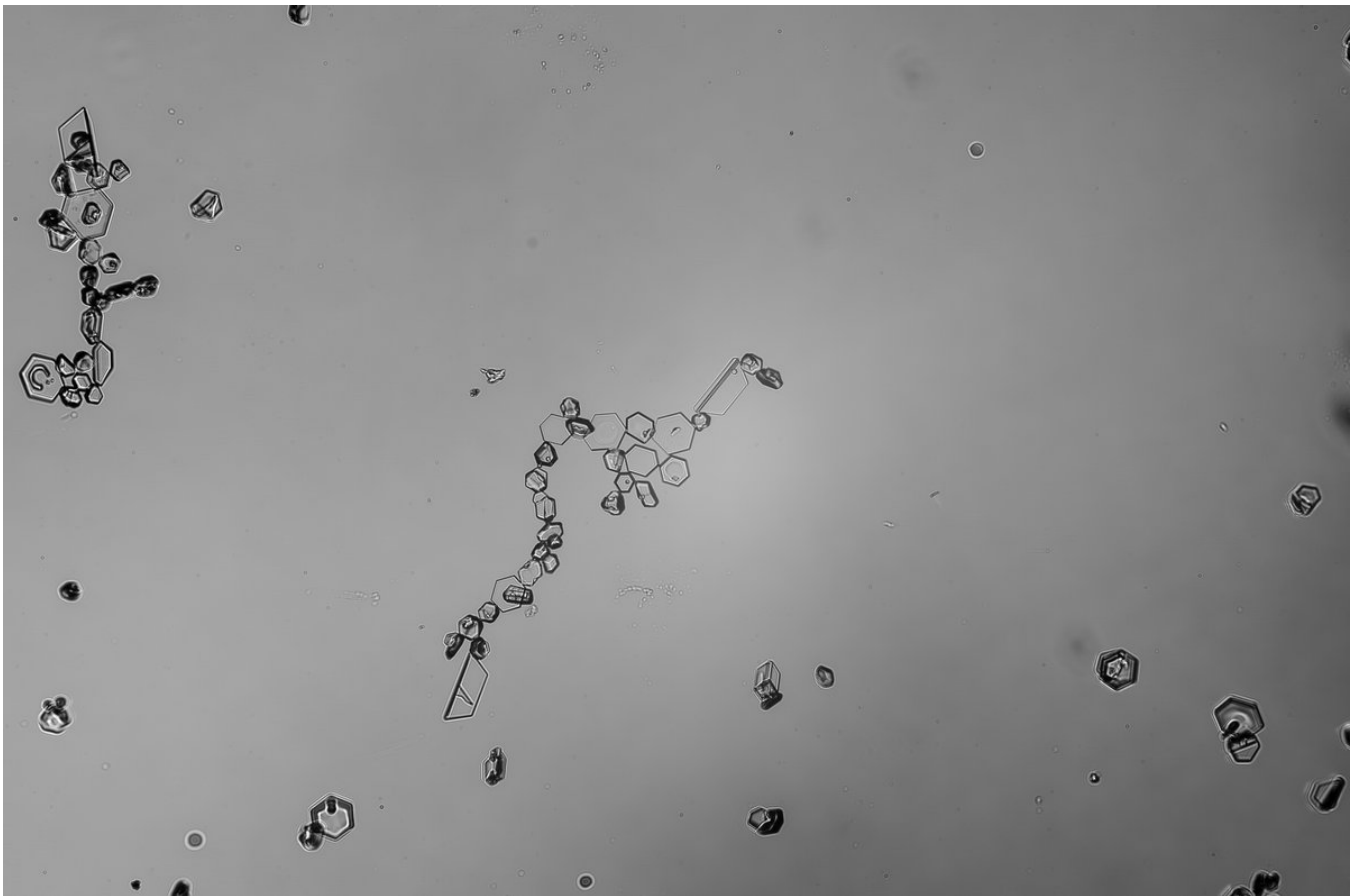

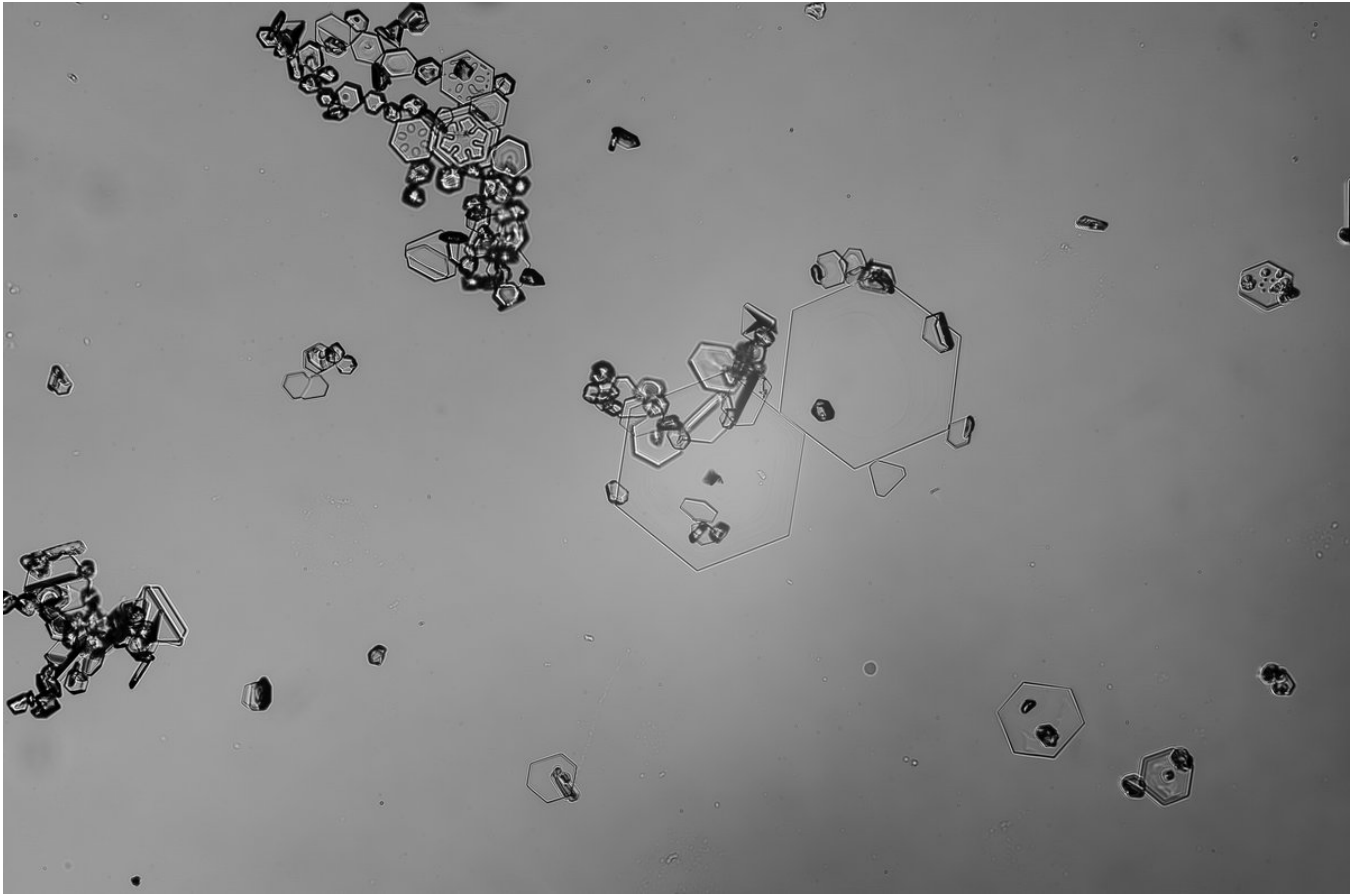

7/8 - 2026-02-25 13:17 UTC

23/24 Feb 2026, Rovaniemi. I need to adjust the microscope "settings" again, there is too much

contrast.
